Topic: BASICS OF JAVA PROGRAMMING-LOOPING

Control Flow in Java

Java compiler executes the java code from top to bottom. The statements are executed according to the order in which they appear. However, Java provides statements that can be used to control the flow of java code. Such statements are called control flow statements.

Java provides three types of control flow statements.

- 1. Decision Making statements
- 2. Loop statements
- 3. Jump statements

Java for Loop

In computer programming, loops are used to repeat a block of code. For example, if you want to show a message 100 times, then rather than typing the same code 100 times, you can use a loop.

In Java, there are three types of loops.

- for loop
- while loop
- do...while loop

Java for Loop

Java for loop is used to run a block of code for a certain number of times. The syntax of for loop is:

for (initialExpression; testExpression; updateExpression) {
 // body of the loop

Here,

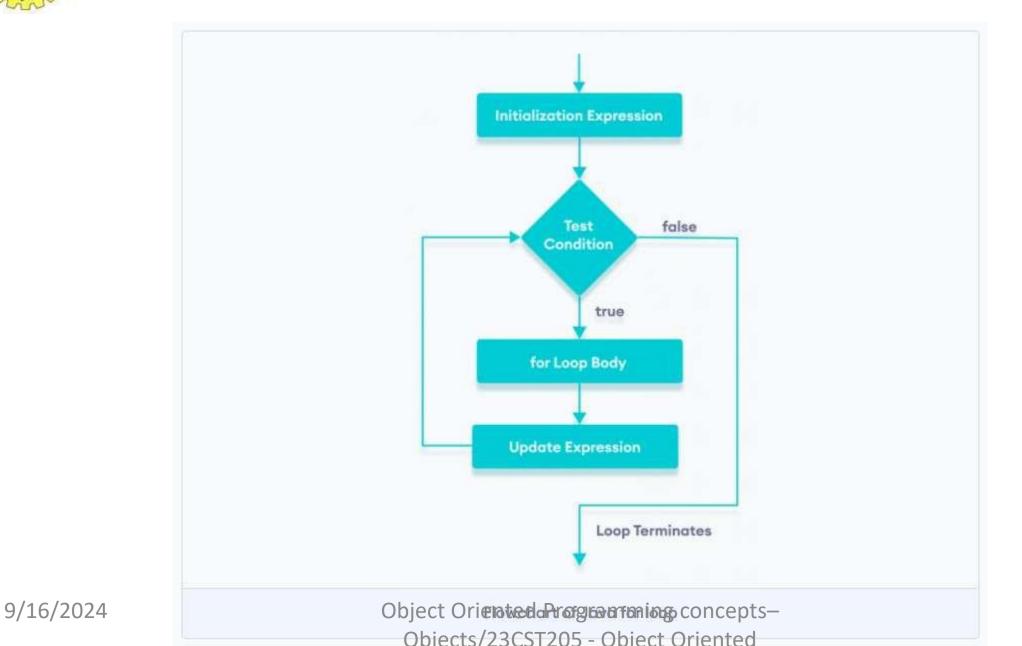

- 1. The **initialExpression** initializes and/or declares variables and executes only once.
- 2. The **condition** is evaluated. If the **condition** is <code>true</code>, the body of the <code>for</code> loop is executed.
- 3. The **updateExpression** updates the value of **initialExpression**.

4. The **condition** is evaluated again. The process continues until the **condition** is false.

Example 1: Display a Text Five Times

```
// Program to print a text 5 times
```

```
class Main {
   public static void main(String[] args) {
```

```
int n = 5;
// for loop
for (int i = 1; i <= n; ++i) {
    System.out.println("Java is fun");
}
</pre>
```

Output
Java is fun Java is fun Java is fun Java is fun Java is fun

7

Here is how this program works.

Iteration	Variable	Condition: i <= n	Action
1st	$\begin{bmatrix} i = 1 \\ n = 5 \end{bmatrix}$	true	Java is fun is printed. i is increased to 2 .
2nd	$\begin{bmatrix} i = 2 \\ n = 5 \end{bmatrix}$	true	Java is fun is printed. i is increased to 3 .
3rd	i = 3 n = 5	true	Java is fun is printed.
4th	$\begin{bmatrix} i = 4 \\ n = 5 \end{bmatrix}$	true	Java is fun is printed. i is increased to 5 .
5th	$ \begin{vmatrix} i &= 5 \\ n &= 5 \end{vmatrix} $	true	Java is fun is printed. i is increased to 6 .
óth	i = 6 $n = 5$	false	The loop is terminated.

Java for-each Loop

Java for-each Loop

In Java, the **for-each** loop is used to iterate through elements of **arrays** and collections (like **ArrayList**). It is also known as the enhanced for loop.

for-each Loop Sytnax

The syntax of the Java for-each loop is:

for(dataType item : array) {

s

Here,

- array an array or a collection
- item each item of array/collection is assigned to this variable
- **dataType** the data type of the array/collection 9/16/2024 Object Oriented Programming concepts- . Objects/23CST205 - Object Oriented

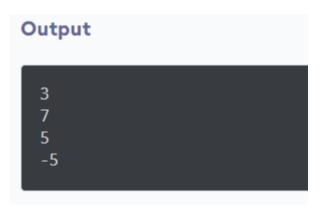

Java for-each Loop

Example 1: Print Array Elements

```
// print array elements
class Main {
  public static void main(String[] args) {
    // create an array
    int[] numbers = {3, 7, 5, -5};
    // iterating through the array
    for (int number: numbers) {
        System.out.println(number);
    }
}
```

for loop Vs for-each loop

Let's see how a for-each loop is different from a regular Java for loop.

1. Using for loop

```
class Main {
  public static void main(String[] args) {
    char[] vowels = {'a', 'e', 'i', 'o', 'u'};
    // iterating through an array using a for loop
    for (int i = 0; i < vowels.length; ++ i) {
        System.out.println(vowels[i]);
    }
  }
}</pre>
```

Java Looping

2. Using for-each Loop

```
class Main {
  public static void main(String[] args) {
    char[] vowels = {'a', 'e', 'i', 'o', 'u'};
    // iterating through an array using the for-each loop
    for (char item: vowels) {
       System.out.println(item);
    }
  }
}
```

Here, the output of both programs is the same. However, the **for-each** loop is easier to write and understand.

This is why the **for-each** loop is preferred over the **for** loop when working with arrays and collections.

Java Infinite for Loop

If we set the **test expression** in such a way that it never evaluates to <code>false</code>, the <code>for</code> loop will run forever. This is called infinite for loop. For example,

```
// Infinite for Loop
```

```
class Infinite {
    public static void main(String[] args) {
        int sum = 0;
        for (int i = 1; i <= 10; --i) {
            System.out.println("Hello");
        }
    }
}</pre>
```

Here, the test expression, i <= 10, is never false and Hello is printed repeatedly until the memory runs out. 9/16/2024 Object Oriented Programming concepts-

Java while Loop

Java while loop

Java while loop is used to run a specific code until a certain condition is met. The syntax of the while loop is:

```
while (testExpression) {
    // body of loop
}
```

Here,

- 1. A while loop evaluates the **textExpression** inside the parenthesis ().
- 2. If the **textExpression** evaluates to true, the code inside the while loop is executed.
- 3. The **textExpression** is evaluated again.
- 4. This process continues until the **textExpression** is false.
- 5. When the **textExpression** evaluates to false, the loop stops.

Java while Loop

Example 1: Display Numbers from 1 to 5

```
// Program to display numbers from 1 to 5
class Main {
  public static void main(String[] args) {
    // declare variables
    int i = 1, n = 5;
    // while loop from 1 to 5

Java do...while loop

The do...while loop is similar to while loop. However, the body of do...while loop is executed once before the test expression is checked. For example,

do {
 // body of loop
} while(textExpression)

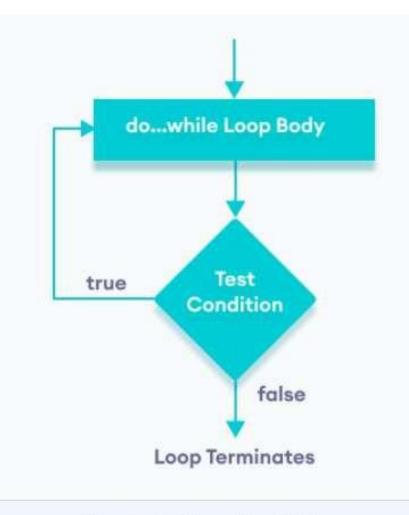

Here,

- 1. The body of the loop is executed at first. Then the **textExpression** is evaluated.
- 2. If the **textExpression** evaluates to true, the body of the loop inside the do statement is executed again.
- 3. The **textExpression** is evaluated once again.
- 4. If the **textExpression** evaluates to true, the body of the loop inside the do statement is executed again.

9/16/2024 This process continues until the **textExpression** evaluates to false. Then the loop stops. Object Oriented Programming concepts.

// Program to find the sum of natural numbers from 1 to 100.
```

```
class Main {
   public static void main(String[] args) {
```

```
int i = 1, n = 5;
```

```
// do...while loop from 1 to 5
do {
   System.out.println(i);
   i++;
   } while(i <= n);
}</pre>

Infinite while loop

If **the condition** of a loop is always true, the loop runs for infinite times (until the memory is full). For example,

```
// infinite while loop
while(true){
    // body of loop
}
Here is an example of an infinite do...while loop.
// infinite do...while loop
int count = 1;
do {
    // body of loop
} while(count == 1)
```

In the above programs, the **textExpression** is always true. Hence, the loop body will run for

9/16/2022 finite times.

Java Looping

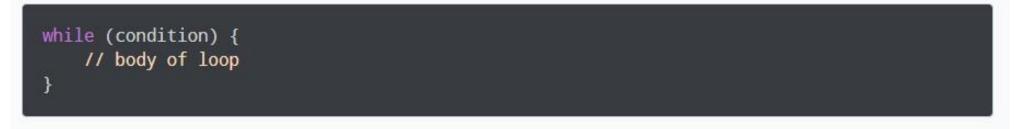

for and while loops

The for loop is used when the number of iterations is known. For example,

```
for (let i = 1; i <=5; ++i) {
    // body of loop
}</pre>
```

And while and do...while loops are generally used when the number of iterations is unknown. For example,
