

Software Requirements

- *Descriptions and specifications of a system*

Topics covered

- Functional and non-functional requirements
- User & System requirements
- Enduring and Volatile requirements
- The software requirements document

Requirements engineering

- The **process of establishing the services** that the **customer requires** from a system and the **constraints** under which it operates and is developed.
- The requirements themselves are the descriptions of the system services and constraints that are generated during the requirements engineering process

What is a requirement?

- It may range from a **high-level abstract statement** of a **service** or of a **system constraint** to a **detailed mathematical functional specification**
- This is inevitable as requirements may serve a dual function
 - May be the basis for **a bid for a contract** - therefore must be open to interpretation
 - May be the basis for **the contract itself** - therefore must be defined in detail
 - Both these statements may be called requirements

Types of requirement

- User requirements
 - Statements in **natural language** plus **diagrams** of the services the system provides and its operational constraints.
Written for customers
- System requirements
 - A **structured document** setting out **detailed descriptions** of the system services. **Written as a contract between client and contractor**
- Software specification
 - A **detailed software description** which can serve as a basis for a **design or implementation**. **Written for developers**

Definitions and specifications

Requirements definition

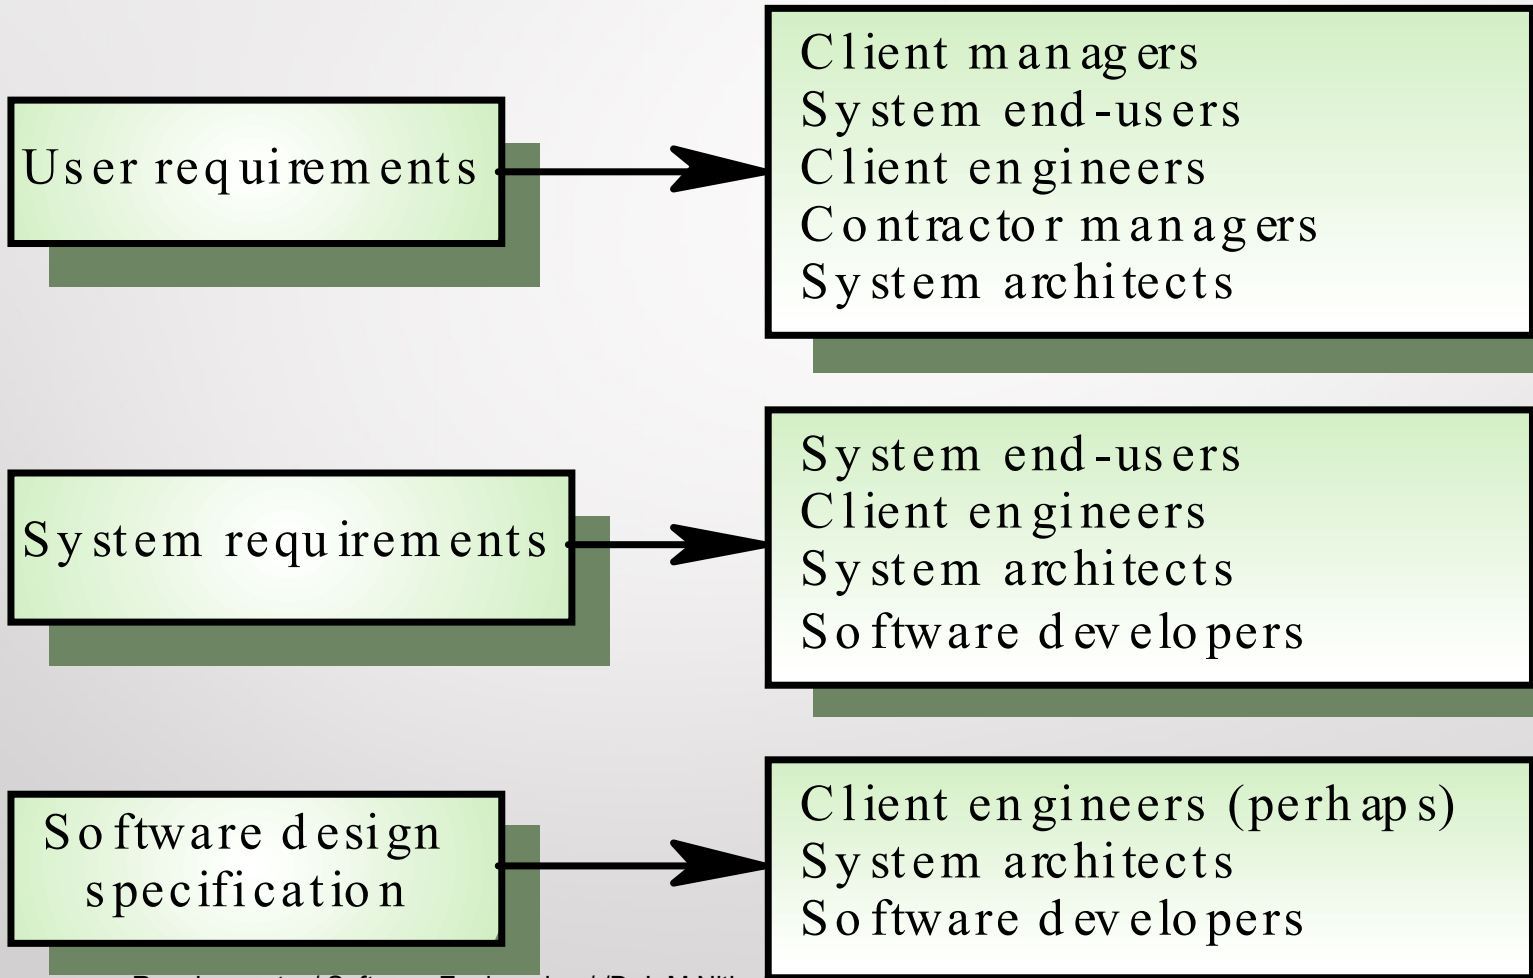

1. The software must provide a means of representing and
1. accessing external files created by other tools.

Requirements specification

- 1.1 The user should be provided with facilities to define the type of
1.2 external files.
- 1.2 Each external file type may have an associated tool which may be
1.2 applied to the file.
- 1.3 Each external file type may be represented as a specific icon on
1.2 the user's display.
- 1.4 Facilities should be provided for the icon representing an
1.2 external file type to be defined by the user.
- 1.5 When a user selects an icon representing an external file, the
1.2 effect of that selection is to apply the tool associated with the type of
1.2 the external file to the file represented by the selected icon.

Requirements readers

Functional and non-functional requirements

- Functional requirements
 - Statements of services the system should provide, how the system should react to particular inputs and how the system should behave in particular situations.
- Non-functional requirements
 - constraints on the services or functions offered by the system such as timing constraints, constraints on the development process, standards, etc.
- Domain requirements
 - Requirements that come from the application domain of the system and that reflect characteristics of that domain

Functional requirements

- Describe **functionality or system services**
- Depend on the type of software, expected users and the type of system where the software is used
- **Functional user requirements** may be **high-level statements of what the system should do** but **functional system requirements** should **describe the system services in detail**

Examples of functional requirements

- The user shall be able to search either all of the initial set of databases or select a subset from it.
- The system shall provide appropriate viewers for the user to read documents in the document store.
- Every order shall be allocated a unique identifier (ORDER_ID) which the user shall be able to copy to the account's permanent storage area.

Requirements imprecision

- Problems arise when requirements are **not precisely stated**
- **Ambiguous requirements** may be interpreted in different ways by developers and users
- Consider the term '**appropriate viewers**'
 - User intention - special purpose viewer for each different document type
 - Developer interpretation - Provide a text viewer that shows the contents of the document

Requirements completeness and consistency

- In principle requirements should be both complete and consistent
- **Complete**
 - They should include descriptions of all facilities required
- **Consistent**
 - There should be no conflicts or contradictions in the descriptions of the system facilities
- In practice, it is impossible to produce a complete and consistent requirements document

Non-functional requirements

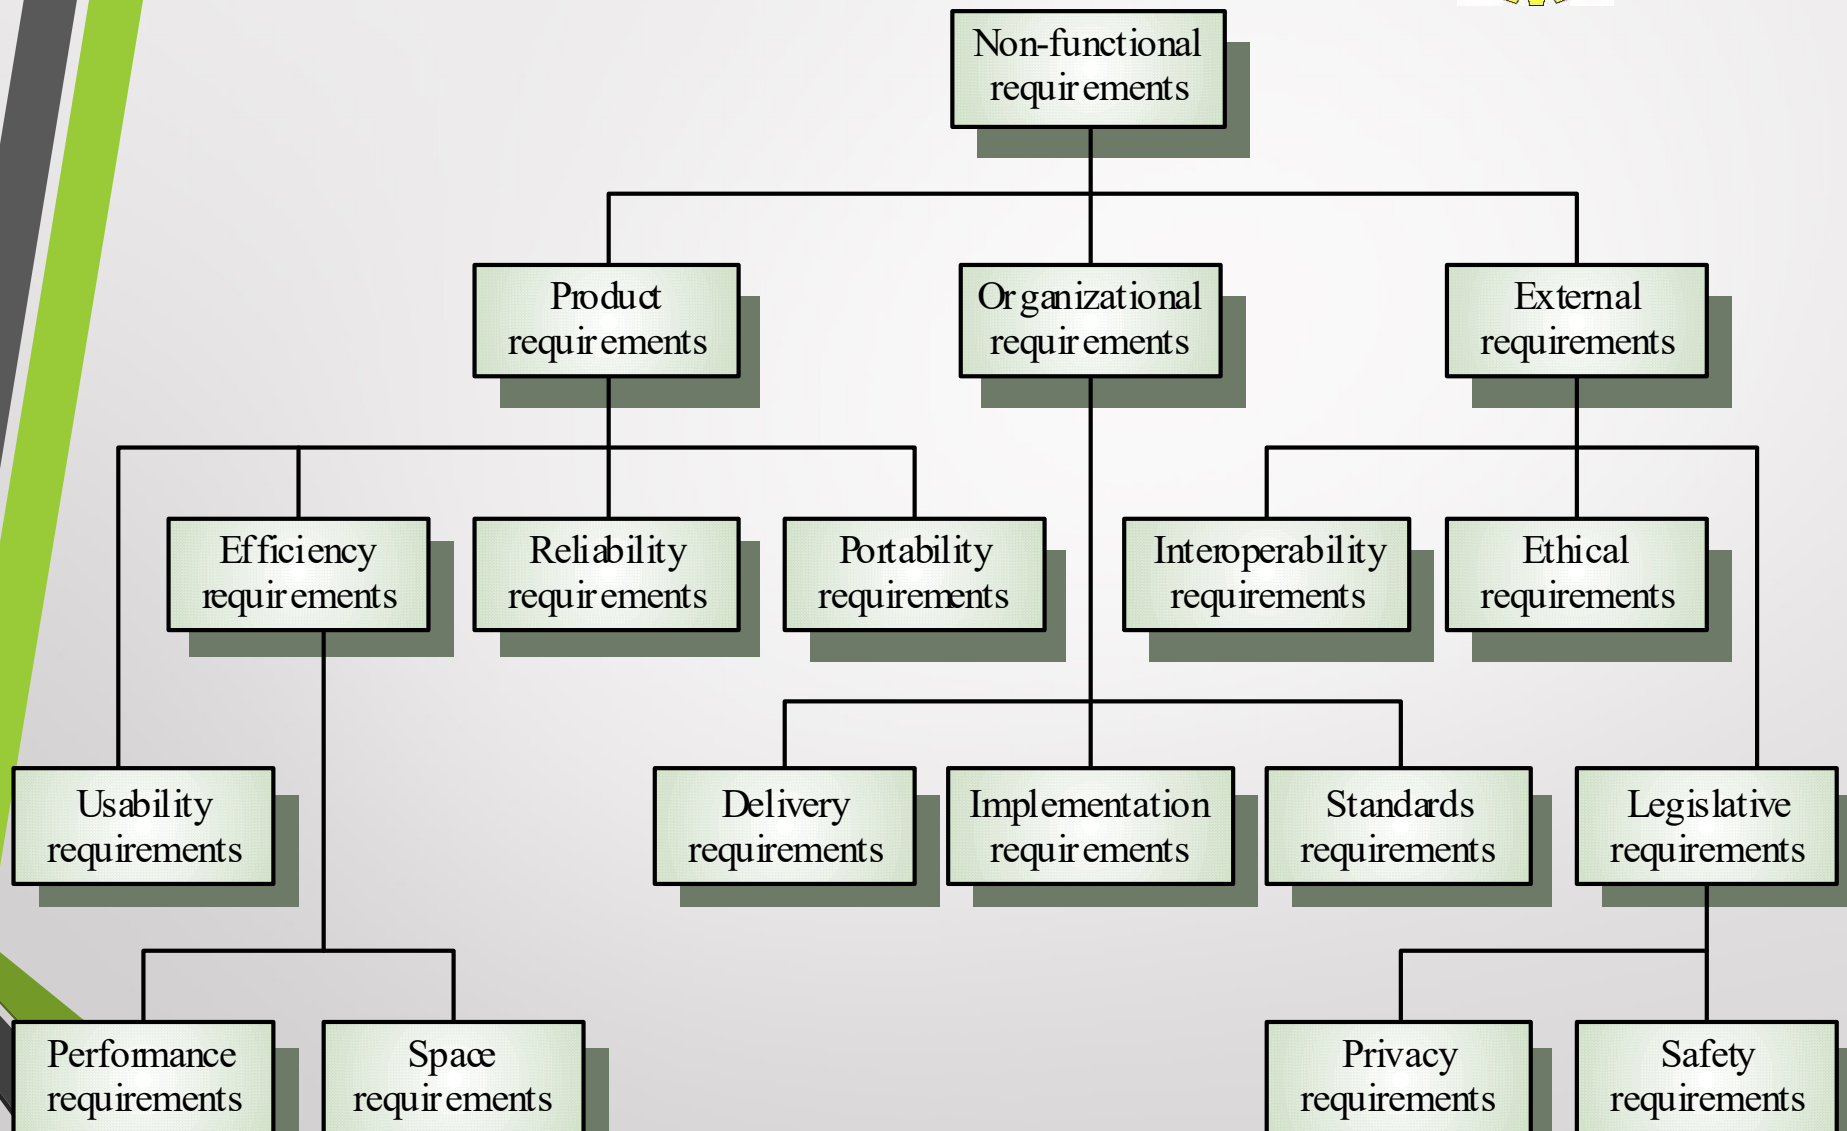

- Define system properties and constraints e.g. reliability, response time and storage requirements. Constraints are I/O device capability, system representations, etc.
- Process requirements may also be specified mandating a particular CASE system, programming language or development method
- Non-functional requirements may be more critical than functional requirements. If these are not met, the system is useless

Non-functional classifications

- **Product requirements**
 - Requirements which specify that the delivered product must behave in a particular way e.g. execution speed, reliability, etc.
- **Organisational requirements**
 - Requirements which are a consequence of organisational policies and procedures e.g. process standards used, implementation requirements, etc.
- **External requirements**
 - Requirements which arise from factors which are external to the system and its development process e.g. interoperability requirements, legislative requirements, etc.

Non-functional requirement types

Goals and requirements

- Non-functional requirements may be **very difficult to state precisely** and **imprecise requirements may be difficult to verify**.
- Goal
 - A general intention of the user such as ease of use
- Verifiable non-functional requirement
 - A statement using some measure that can be objectively tested
- Goals are helpful to developers as they convey the intentions of the system users

Examples

- **A system goal**
 - The system **should be easy to use by experienced controllers and should be organised in such a way that user errors are minimised.**
- **A verifiable non-functional requirement**
 - Experienced controllers shall be able to use all the system functions **after a total of two hours training.**
 - After this training, the **average number of errors made by experienced users shall not exceed two per day.**

Requirements measures

Property	Measure
Speed	Processed transactions/second User/Event response time Screen refresh time
Size	K Bytes Number of RAM chips
Ease of use	Training time Number of help frames
Reliability	Mean time to failure Probability of unavailability Rate of failure occurrence Availability
Robustness	Time to restart after failure Percentage of events causing failure Probability of data corruption on failure
Portability	Percentage of target dependent statements Number of target systems

Requirements interaction

- Conflicts between different non-functional requirements are common in complex systems
- Spacecraft system
 - To minimise weight, the number of separate chips in the system should be minimised
 - To minimise power consumption, lower power chips should be used
 - However, using low power chips may mean that more chips have to be used. Which is the most critical requirement?

Domain requirements

- Derived from the application domain and **describe system characteristics and features that reflect the domain**
- **May be new functional requirements**, constraints on existing requirements or define specific computations
- If domain requirements are not satisfied, the system may be unworkable

Library system domain requirements

- There shall be a standard user interface to all databases which shall be based on the Z39.50 standard.
- Because of copyright restrictions, some documents must be deleted immediately on arrival. Depending on the user's requirements, these documents will either be printed locally on the system server for manually forwarding to the user or routed to a network printer.

Train protection system

- The deceleration of the train shall be computed as:

- $D_{\text{train}} = D_{\text{control}} + D_{\text{gradient}}$

where D_{gradient} is 9.81ms^2 * compensated gradient/alpha and where the values of 9.81ms^2 /alpha are known for different types of train.

Domain requirements problems

- **Understandability**
 - Requirements are expressed in the language of the application domain
 - This is often not understood by software engineers developing the system
- **Implicitness**
 - Domain specialists understand the area so well that they do not think of making the domain requirements explicit

User requirements

- Should describe functional and non-functional requirements so that they are understandable by system users who don't have detailed technical knowledge
- User requirements are defined using natural language, tables and diagrams

Problems with natural language

- Lack of clarity
 - Precision is difficult without making the document difficult to read
- Requirements confusion
 - Functional and non-functional requirements tend to be mixed-up
- Requirements amalgamation
 - Several different requirements may be expressed together

Guidelines for writing requirements

- Invent a **standard format** and use it for all requirements
- Use language in a **consistent way**.
- Use **shall** for mandatory requirements, **should** for desirable requirements
- Use text highlighting to identify key parts of the requirement
- **Avoid the use of computer jargon**

System requirements

- More detailed specifications of user requirements
- Serve as a basis for designing the system
- May be used as part of the system contract

Requirements and design

- In principle, requirements should state what the system should do and the design should describe how it does this
- In practice, requirements and design are inseparable
 - A system architecture may be designed to structure the requirements
 - The system may inter-operate with other systems that generate design requirements
 - The use of a specific design may be a domain requirement

Enduring and volatile requirements

- **Enduring requirements.** Stable requirements derived from the core activity of the customer organisation. E.g. a hospital will always have doctors, nurses, etc. May be derived from domain models
- **Volatile requirements.** Requirements which change during development or when the system is in use. In a hospital, requirements derived from health-care policy
