Jaylor SERIES METHOD:
Consider the first order differential eqn.

$$\frac{dy}{d\pi} = f(\pi, y) \quad with \quad y(\pi_0) = y_0 .$$
Hence the Taylor's series expansion of $y(\omega)$ is
yiven by
 $y(\alpha) = y_0 + (\pi - \pi_0) y_0' + (\pi - \pi_0)^2 y_0'' + \dots$
Let $\pi_1 = \pi_0 + h$
 $y(\pi_1) = y_1 = y_0 + \frac{h}{1!} y_0' + \frac{h^2}{2!} y_0'' + \dots$
Now let $\pi_2 = \pi_1 + h$
 $y(\pi_2) = y_2 = y_1 + \frac{h}{1!} y_1' + \frac{h^2}{2!} y_1'' + \dots$
(1) Using Taylor series method find y at $\pi = 0.1$
 $\hat{y} = \frac{dy}{d\pi} = \pi^2 y_1 = 1, \quad y(p) = 1$

By Taylor Soules for
$$y_1$$
 and z_1 we have.
 $y_1 = y(o_1) = y_0 + hy_0' + \frac{h^2}{2!} y_0'' + \frac{h^3}{3!} y_0''' + \cdots$
 $= 1 + (o_1)(1) + \frac{(o_1)^2}{2!}(1) + \frac{(o_1)^3}{3!}(0) + \frac{(o_1)^4}{4!}(1) + \cdots$
 $= 1 \cdot 1050$
 $z_1 = z_0 + hz_0' + \frac{h^2}{2!} z_0''' + \frac{h^3}{3!} z_0''' + \cdots$
 $= 1 + (o_1)(1) + \frac{(o_1)^2}{2!}(2) + \frac{(o_1)^3}{3!}(1) + \frac{(o_1)^4}{4!}(0) + \cdots$
 $= 1 \cdot 1001$
Find $y(o_3) & z_1(o_3)$ given $\frac{dz}{d\pi} = -\pi y$, $\frac{dy}{d\pi} = 1 + \pi z_2$ with
 $y(o) = 0 & z_1(o) = 1$
Here $\pi_0 = 0$, $y_0 = 0$, $z_0 = 1$ & $h = 0.3$
