## UNIT 3 PARTIAL DIFFERENTIAL EQUATIONS

Linear partial differential equations of second order with constant coefficients of homogeneous types

Linear PDE With constant coefficients

Homogeneous Linear PDE's:

A Linear PDE with constant coefficients in which all the postial desiratives are of the same order is called homogenous, otherwise it is called non-homogenous

Example: Homogenous Equation:

$$\frac{\partial^2 Z}{\partial x^2} + 5 \frac{\partial^2 Z}{\partial x \partial y} + 6 \frac{\partial^2 Z}{\partial y^2} = Sin x.$$

Non Homogeneous Equation!

Homogeneous Equation:
$$\frac{\partial^2 z}{\partial x^2} - 5\frac{\partial z}{\partial x} + 7\frac{\partial^2}{\partial y} + \frac{\partial^2 z}{\partial y^2} = e^{2x+y}$$

Notation! 
$$D = \frac{\partial}{\partial x}$$
,  $D' = \frac{\partial}{\partial y}$ 

Method of finding complementary function (CF): Let the guien equalion be of the form

Put D=m , D'= 1 23MAT103-+(mi) = 0 > aom + aim + ... + ai = 0

 $CF = \frac{1}{1}(y + 2x) + \frac{1}{1}(y + 3x)$ 
 $PI = \frac{1}{D^2 - 5DD' + 6D^2}$ 
 $PI = \frac{1}{D^2 - 5DD' + 6D^2}$
