## UNIT 3 PARTIAL DIFFERENTIAL EQUATIONS

Linear partial differential equations of second order with constant coefficients of homogeneous types

Linear PDE <sup>of 2<sup>nd</sup> order</sup> with constant coefficients

Homogeneous Linear PDE's:

A linear PDE with constant coefficients in which all the partial derivatives are of the same order is called homogeneous, otherwise it is called non-homogeneous.

Example:

Homogeneous Equation:-

$$\frac{\partial^2 z}{\partial x^2} + 5 \frac{\partial^2 z}{\partial xy} + 6 \frac{\partial^2 z}{\partial y^2} = \sin x.$$

Non Homogeneous Equation!

$$\frac{\partial^2 z}{\partial x^2} - 5 \frac{\partial z}{\partial x} + 7 \frac{\partial z}{\partial y} + \frac{\partial^2 z}{\partial y^2} = e^{x+y}$$

Notation:  $D = \frac{\partial}{\partial x}, D' = \frac{\partial}{\partial y}$

Method of finding complementary function (CF):

Let the given equation be of the form

$$f(D, D')z = f(x, y)$$

Put  $D = m, D' = l$

$$f(m, l) = 0 \Rightarrow a_0m^n + a_1m^{n-1} + \dots + a_l = 0$$

General solution is  $y = CF + PI$

$$RHS = 0 \quad (z = CF)$$

1. Solve  $(D^2 - 6DD' + 9D'^2)z = 0$

Put  $D = m$ ,  $D' = 1$

The auxiliary equation is,

$$m^2 - 6m + 9 = 0$$

$$(m-3)(m-3) = 0$$

$$m = 3, 3 \text{ (equal)}$$

The solution is  $z = CF = f_1(y+3x) + f_2(y+3x)$

Type-I  
1. Solve  $(D^2 - 5DD' + 6D'^2)z = e^{xt+y}$

The auxiliary equation is,

$$m^2 - 5m + 6 = 0$$

$$(m-3)(m-2) = 0$$

$$m = 2, 3$$

$$CF = f_1(y+2x) + f_2(y+3x)$$

$$PI = \frac{1}{D^2 - 5DD' + 6D'^2} e^{xt+y}$$

$$= \frac{1}{1-5+b} e^{xt+y}$$

$$= \frac{1}{1-5+2} e^{xt+y}$$

Replace

$$D \rightarrow a = 1$$

$$D' \rightarrow b = 1$$

The solution is  $z = CF + PI$

$$= f_1(y+2x) + f_2(y+3x) + \frac{e^{xt+y}}{2}$$

Q.T.Y.P. Solve :  $(D^2 - 4DD' + 4D'^2)Z = e^{2x+y}$

The auxiliary equation is

$$m^2 - 4m + 4 = 0$$

$$(m-2)(m-2) = 0.$$

$$m=2, 2 \text{ (equal)}$$

$$CF = f_1(y+2x) + xf_2(y+2x)$$

$$\begin{aligned} PI &= \frac{1}{D^2 - 4DD' + 4D'^2} e^{2x+y} \\ &= \frac{1}{2^2 - 4(2)(1) + 4(1)^2} e^{2x+y} \\ &= \frac{1}{4-8+4} e^{2x+y} \\ &= x \frac{1}{2D-4D'} e^{2x+y} = x \frac{1}{2(2)-4(1)} e^{2x+y} \\ &= x^2 \frac{e^{2x+y}}{2} = \frac{x^2}{2} e^{2x+y}. \end{aligned}$$

Replace

$$\begin{aligned} D &\rightarrow a = 2 \\ D' &\rightarrow b = 1 \end{aligned}$$

The solution is  $Z = CF + PI$

$$= f_1(y+2x) + xf_2(y+2x) + \frac{x^2}{2} e^{2x+y}$$

Q.T.Y.P. Solve :  $2\frac{\partial^2 Z}{\partial x^2} + 5\frac{\partial^2 Z}{\partial x \partial y} + 2\frac{\partial^2 Z}{\partial y^2} = 0.$

Given:  $(2D^2 + 5DD' + 2D'^2)Z = 0.$

A.E is  $2m^2 + 5m + 2 = 0$

$$2m^2 + 4m + m + 2 = 0$$

$$2m(m+2) + 1(m+2) = 0$$

$$(2m+1)(m+2) = 0 \quad m_1 = -\frac{1}{2}, \quad m_2 = -2 \Rightarrow \text{roots are different}$$

# SNS COLLEGE OF TECHNOLOGY

(An Autonomous Institution)

$$CF \Rightarrow z = f_1(y - \frac{1}{2}x) + f_2(y - 2x)$$

$$PI \Rightarrow PI = 0.$$

$$\therefore \text{solution is } z = CF + PI$$

$$= f_1(y - \frac{1}{2}x) + f_2(y - 2x)$$

To find Particular Integral (PI)

$$\text{Type I: RHS} = f(x, y) = e^{ax+by}$$

$$PI = \frac{1}{\phi(p, D')} e^{ax+by}$$

$$\text{Replace } D \rightarrow a, D' \rightarrow b$$

$$\text{then } PI = \frac{1}{\phi(a, b)} e^{ax+by}, \text{ provided } \phi(a, b) \neq 0$$

If  $\phi(a, b) = 0$  then differentiate the denominator w.r.t 'D'

and multiply by  $x$  is Numerator.

$$\text{Ex. Solve: } (2D^2 - 2DD' + D'^2)z = 2e^{3y} + e^{xy}.$$

$$\text{AE is } 2m^2 - 2m + 1 = 0$$

$$m = \frac{-(-2) \pm \sqrt{(-2)^2 - 4(2)(1)}}{2(2)} = \frac{2 \pm \sqrt{4-8}}{4} = \frac{2 \pm 2i}{4} = \frac{1 \pm i}{2}$$

$$m = \frac{1}{2} \pm \frac{1}{2}i$$

$\therefore$  The roots are imaginary

$$CF \text{ is } z = f_1\left(y + x\left(\frac{1}{2} + \frac{1}{2}i\right)\right) + f_2\left(y + \left(\frac{1}{2} - \frac{1}{2}i\right)x\right)$$

$$PI \Rightarrow PI_1 = \frac{1}{2D^2 - 2DD' + D'^2} 2e^{3y} \rightarrow D=0 \& D'=3$$

$$= \frac{1}{2(0) - 2(0)(3) + (3)^2} 2e^{3y} = \frac{2}{9} e^{3y}.$$

## SNS COLLEGE OF TECHNOLOGY

(An Autonomous Institution)

Approved by AICTE, New Delhi, Affiliated to Anna University, Chennai  
Accredited by NAAC-UGC with 'A++' Grade (Cycle III) & ;  
Accredited by NBA (B.E - CSE, EEE, ECE, Mech & ; B.Tech.IT)  
COIMBATORE-641 035, TAMIL NADU

$$PI_2 = \frac{1}{D^2 - 2DD' + D'^2} e^{x+y} \quad \Rightarrow D=1, D'=1$$

$$= \frac{1}{(1)^2 - 2(1)(1) + (1)^2} e^{x+y}$$

$$= e^{x+y}$$

∴ The solution is  $Z = CF + PI$   
 $Z = f_1(y + (\frac{1}{2} + \frac{1}{2}i)) + f_2(y + (\frac{1}{2} - \frac{1}{2}i)) + \frac{1}{9} e^{3y} + e^{x+y}$

a. Solve:  $(D^2 - 3DD' + 2D'^2)Z = e^{3x+2y}$

AE is  $m^2 - 3m + 2 = 0$

$$(m-2)(m-1) = 0.$$

$$m_1 = 1, m_2 = 2$$

CF is  $Z = f_1(y+x) + f_2(y+2x)$

$$PI = \frac{1}{D^2 - 3DD' + 2D'^2} e^{3x+2y} \quad D=3, D'=2$$

$$= \frac{1}{(3)^2 - 3(3)(2) + 2(2)^2} e^{3x+2y}$$

$$= \frac{1}{9-18+8} e^{3x+2y} = -e^{3x+2y}$$

∴ The solution is  $Z = CF + PI$

$$= f_1(y+x) + f_2(y+2x) - e^{3x+2y}$$

b. Solve:  $(D^2 - DD' - 2D'^2)Z = e^{5x+y}$

AE is  $m^2 - m - 20 = 0$

$$(m-5)(m+4) = 0 \quad m_1 = -4, m_2 = 5$$

∴ CF is  $Z = f_1(y-4x) + f_2(y+5x)$

 Accredited by NBA (B.E - CSE, EEE, ECE, Mech & ; B.Tech.IT)  
 COIMBATORE-641 035, TAMIL NADU

$$\begin{aligned}
 5. PI &= \frac{1}{D^2 - 2DD' - 2D'D'^2} e^{5x+y} \quad D = 5, D' = 1 \\
 &= \frac{1}{(5)^2 - (5)(1) - 2(5)(1)} e^{5x+y} = \frac{1}{25 - 5 - 20} e^{5x+y} \\
 &= \frac{x}{2D - D'} e^{5x+y} = \frac{x}{2(5) - 1} e^{5x+y} \\
 &= \frac{x}{9} e^{5x+y}
 \end{aligned}$$

$$\begin{aligned}
 \therefore \text{The solution is } z &= CF + PI \\
 &= f_1(y-4x) + f_2(y+5x) + \frac{x e^{5x+y}}{9}
 \end{aligned}$$

$$\begin{aligned}
 6. \text{ Solve: } (D^2 + 2DD' + D'^2)z &= e^{x-y} \\
 AE \text{ is } m^2 + 2m + 1 = 0 \Rightarrow (m+1)(m+1) &= 0. \\
 m = -1, -1 \quad \text{Roots are equal} & \\
 \therefore CF \text{ is } z &= f_1(y-x) + xf_2(y-x)
 \end{aligned}$$

$$PI = \frac{1}{D^2 + 2DD' + D'^2} e^{x-y} \quad D = 1, D' = -1$$

$$= \frac{1}{(1)^2 + 2(1)(-1) + (-1)^2} e^{x-y} = \frac{e^{x-y}}{1 - 2 + 1}$$

$$= \frac{x}{2D + 2D'} e^{x-y} = \frac{x}{2(1) + 2(-1)} e^{x-y}$$

$$= \frac{x^2}{2} e^{x-y}$$

$$\begin{aligned}
 \text{The solution is } z &= CF + PI \\
 &= f_1(y-x) + xf_2(y-x) + \frac{x^2}{2} e^{x-y}.
 \end{aligned}$$
