## 23CST202 – Operating Systems **II YEAR - IV SEM**

## **UNIT 2 – PROCESS SCHEDULING AND SYNCHRONIZATION**

## **TOPIC 1 – CPU Scheduling**

## **Syllabus**

## **UNIT I**

## **OVERVIEW AND PROCESS MANAGEMENT**

Introduction - Computer System Organization, Architecture, Operation, Process Management - Memory Management - Storage Management -Operating System – Process concept – Process scheduling – Operations on processes – Cooperating processes – Inter process communication. Threads -Multi-threading Models – Threading issues.

## **PROCESS SCHEDULING AND SYNCHRONIZATION**

CPU Scheduling - Scheduling criteria – Scheduling algorithms – Multiple-processor scheduling – Real time scheduling – Algorithm Evaluation. Process Synchronization - The critical-section problem - Synchronization hardware - Semaphores - Classical problems of synchronization. Deadlock - System model – Deadlock characterization – Methods for handling deadlocks – Deadlock prevention – Deadlock avoidance – Deadlock detection – Recovery from deadlock.

## **UNIT III**

**UNIT II** 

## **MEMORY MANAGEMENT**

Memory Management - Background - Swapping - Contiguous memory allocation - Paging - Segmentation - Segmentation with paging. Virtual Memory - Background – Demand paging – Process creation – Page replacement – Allocation of frames – Thrashing. **UNIT IV FILE SYSTEMS** 

## 8

File concept - Access methods - Directory structure - Files System Mounting - File Sharing - Protection. File System Implementation - Directory implementation – Allocation methods – Free-space management.

## **I/O SYSTEMS UNIT V**

I/O Systems - I/O Hardware - Application I/O interface - Kernel I/O subsystem - Streams - Performance. Mass-Storage Structure: Disk scheduling -Disk management – Swap-space management – RAID – Disk attachment – Stable storage – Tertiary storage. Case study: Implementation of Distributed File system in Cloud OS / Mobile OS.

# **CPU Scheduling**

- Basic Concepts
- Scheduling Criteria
- Scheduling Algorithms
- Multiple-Processor Scheduling
- Real-Time Scheduling
- Algorithm Evaluation

# **Basic Concepts**

- Maximum CPU utilization obtained multiprogramming
- CPU–I/O Burst Cycle Process execution consists of a cycle of CPU execution and I/O wait.
- CPU burst distribution

# with

# Alternating Sequence of CPU And I/O Bursts

Scheduling/ 23<mark>CST202 - Operating Systems/ Anand Kumar. N/IT/SNSCT</mark>

## **Histogram of CPU-burst Times**

Scheduling/23CST202 - Operating Systems/Anand Kumar. N/IT/SNSCT

# **CPU Scheduler**

- Selects from among the processes in memory that are ready to execute, and allocates the CPU to one of them.
- CPU scheduling decisions may take place when a process:
  - Switches from running to waiting state.
  - 2. Switches from running to ready state.
  - 3. Switches from waiting to ready.
  - Terminates. 4.
- Scheduling under 1 and 4 is *nonpreemptive*.
- All other scheduling is *preemptive*.

# Dispatcher

- Dispatcher module gives control of the CPU to the process selected by the short-term scheduler; this involves:
  - switching context
  - switching to user mode
  - jumping to the proper location in the user program to restart that program
- Dispatch latency time it takes for the dispatcher to stop  $\bullet$ one process and start another running.

# **Scheduling Criteria**

- <u>CPU utilization</u> keep the CPU as busy as possible
- <u>Throughput</u> # of processes that complete their execution per time unit
- <u>Turnaround time</u> amount of time to execute a particular process
- <u>Waiting time</u> amount of time a process has been waiting in the ready queue
- Response time amount of time it takes from when a  $\bullet$ request was submitted until the first response is produced, not output (for time-sharing environment)

# **Optimization Criteria**

- Max CPU utilization
- Max throughput
- Min turnaround time
- Min waiting time
- Min response time

# First-Come, First-Served (FCFS) Scheduling

- Process Burst Time  $P_1 = 24$  $\begin{array}{cc} P_2 & 3 \\ P_3 & 3 \end{array}$
- Suppose that the processes arrive in the order:  $P_1$ ,  $P_2$ ,  $P_3$ The Gantt Chart for the schedule is:

- Waiting time for  $P_1 = 0; P_2 = 24; P_3 = 27$
- Average waiting time: (0 + 24 + 27)/3 = 17lacksquare

# **FCFS Scheduling (Cont.)**

Suppose that the processes arrive in the order

The Gantt chart for the schedule is:

|   | P <sub>2</sub> | P <sub>3</sub> | P <sub>1</sub> |
|---|----------------|----------------|----------------|
| 0 | 3              | 6              | 30             |

- Waiting time for P1 = 6; P2 = 0; P3 = 3
- Average waiting time: (6+0+3)/3 = 3
- Much better than previous case. ullet
- Convoy effect short process behind long process

- Associate with each process the length of its next CPU burst. Use these lengths to schedule the process with the shortest time.
- Two schemes:
  - <u>nonpreemptive</u> once CPU given to the process it cannot be preempted until completes its CPU burst.
  - <u>preemptive</u> if a new process arrives with CPU burst length less than remaining time of current executing process, preempt. This scheme is know as the Shortest-Remaining-Time-First (SRTF).
- SJF is optimal gives minimum average waiting time for a given set of processes.

# **Example of Non-Preemptive SJF**

- Process Arrival Time Burst Time **P1** 0.0 7 2.0 4 P2 4.0 1 P3 P4 5.0 4
- SJF (non-preemptive)

• Average waiting time = (0 + 6 + 3 + 7)/4 - 4

Scheduling/23CST202 - Operating Systems/Anand Kumar. N/IT/SNSCT

# **Example of Preemptive SJF**

Average waiting time = (9 + 1 + 0 + 2)/4 - 3

Scheduling/23CST202 - Operating Systems/Anand Kumar. N/IT/SNSCT
