<u>UNIT V</u>

MULTITHREADING IN JAVA

Multithreading

Multithreading in <u>Java</u> is a process of executing multiple threads simultaneously.

A thread is a lightweight sub-process, the smallest unit of processing. Multiprocessing and multithreading, both are used to achieve multitasking.

However, we use multithreading than multiprocessing because threads use a shared memory area. They don't allocate separate memory area so saves memory, and context-switching between the threads takes less time than process.

Java Multithreading is mostly used in games, animation, etc.

Advantages of Java Multithreading

1) It **doesn't block the user** because threads are independent and you can perform multiple operations at the same time.

2) You can perform many operations together, so it saves time.

3) Threads are **independent**, so it doesn't affect other threads if an exception occurs in a single thread.

Multitasking

Multitasking is a process of executing multiple tasks simultaneously. We use multitasking to utilize the CPU. Multitasking can be achieved in two ways:

- Process-based Multitasking (Multiprocessing)
- Thread-based Multitasking (Multithreading)

1) Process-based Multitasking (Multiprocessing)

- Each process has an address in memory. In other words, each process allocates a separate memory area.
- A process is heavyweight.
- Cost of communication between the process is high.Switching from one process to another requires some time for saving and loading registers, memory maps, updating lists, etc.

2) Thread-based Multitasking (Multithreading)

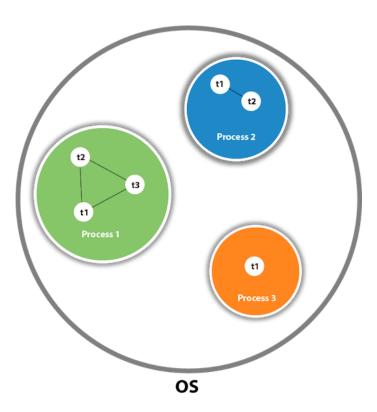

- Threads share the same address space.
- A thread is lightweight.
- \circ Cost of communication between the thread is low.

Note: At least one process is required for each thread.

What is Thread in java

A thread is a lightweight subprocess, the smallest unit of processing. It is a separate path of execution.

Threads are independent. If there occurs exception in one thread, it doesn't affect other threads. It uses a shared memory area.

As shown in the above figure, a thread is executed inside the process. There is context-switching between the threads. There can be multiple processes inside the <u>OS</u>, and one process can have multiple threads.

Note: At a time one thread is executed only.

Java Thread class

Java provides **Thread class** to achieve thread programming. Thread class provides <u>constructors</u> and methods to create and perform operations on a thread. Thread class extends <u>Object class</u> and implements Runnable interface.

Java Thread Methods

S. N.	Modifier and Type	Method	Descripti on
1)	void	<u>start()</u>	It is used to

			start the execution of the thread.
2)	void	<u>run()</u>	It is used to do an action for a thread.
3)	static void	<u>sleep()</u>	It sleeps a thread for the specified amount of time.
4)	static Thread	<u>currentThread()</u>	It returns a reference to the currently executing thread object.
5)	void	<u>join()</u>	It waits for a thread to die.
6)	int	getPriority()	Itreturnsthepriority

			of the thread.
7)	void	<u>setPriority()</u>	It changes the priority of the thread.
8)	String	<u>getName()</u>	It returns the name of the thread.
9)	void	<u>setName()</u>	It changes the name of the thread.
10)	long	<u>getId()</u>	It returns the id of the thread.
11)	boolean	<u>isAlive()</u>	It tests if the thread is alive.
12)	static void	<u>yield()</u>	Itcausesthe \cdot currently \cdot executing \cdot thread \cdot objecttopauseandallowother

Ms.B.Sumathi

			threads to execute temporarily
13)	void	suspend()	It is used to suspend the thread.
14)	void	resume()	It is used to resume the suspended thread.
15)	void	<u>stop()</u>	It is used to stop the thread.
16)	void	<u>destroy()</u>	It is used to destroy the thread group and all of its subgroups.
17)	boolean	isDaemon()	It tests if the thread is a daemon thread.
18)	void	<u>setDaemon()</u>	It marks the thread as

Ms.B.Sumathi

			daemon or user thread.
19)	void	<u>interrupt()</u>	It interrupts the thread.
20)	boolean	isinterrupted()	It tests whether the thread has been interruted.
21)	static boolean	interrupted()	It tests whether the current thread has been interrupted.
22)	static int	activeCount()	Itreturnsthenumberof $active$ threadsinthecurrentthread'sthreadgroup.
23)	void	<u>checkAccess()</u>	It determines if the

			currently running thread has permission to modify the thread.
24)	static boolean	holdLock()	It returns true if and only if the only if the current the thread the holds the noonitor the lock on the specified object.
25)	static void	<u>dumpStack()</u>	It is used to print a stack trace of the current thread to the standard error stream.
26)	StackTraceElement[]	getStackTrace()	It returns

Ms.B.Sumathi

			an array of stack trace elements representin g the stack dump of the thread.
27)	static int	enumerate()	It is used to copy every active thread's thread group and its subgroup into the specified array.
28)	Thread.State	getState()	It is used to return the state of the thread.
29)	ThreadGroup	<u>getThreadGroup()</u>	It is used to return the thread to group to which this

			thread belongs
30)	String	toString()	It is used to return a string representati on of this thread, including the thread's name, priority, and thread group.
31)	void	notify()	It is used to give the notification for only one thread which is waiting for a particular object.
32)	void	notifyAll()	It is used to give the notification to all

			waiting threads of a particular
			object.
33)	void	<u>setContextClassLoader()</u>	It sets the context ClassLoade r for the Thread.
34)	ClassLoader	getContextClassLoader()	It returns the context ClassLoade r for the thread.
35)	static Thread.UncaughtExceptionH andler	getDefaultUncaughtExceptionHa ndler()	Itreturnsthedefaulthandlerinvokedwhenathreadabruptlyterminatesduetouncaughtexception.
36)	static void	setDefaultUncaughtExceptionHa ndler()	It sets the default
