DEPARTMENT OF INFORMATION TECHNOLOGY

16IT AUGMENTED REALITY AND VIRTUAL REALITY

III YEAR – V SEM

UNIT 4 – INTERACTIVE TECHNIQUES AND TOOLS

TOPIC 3 –Input Interfaces
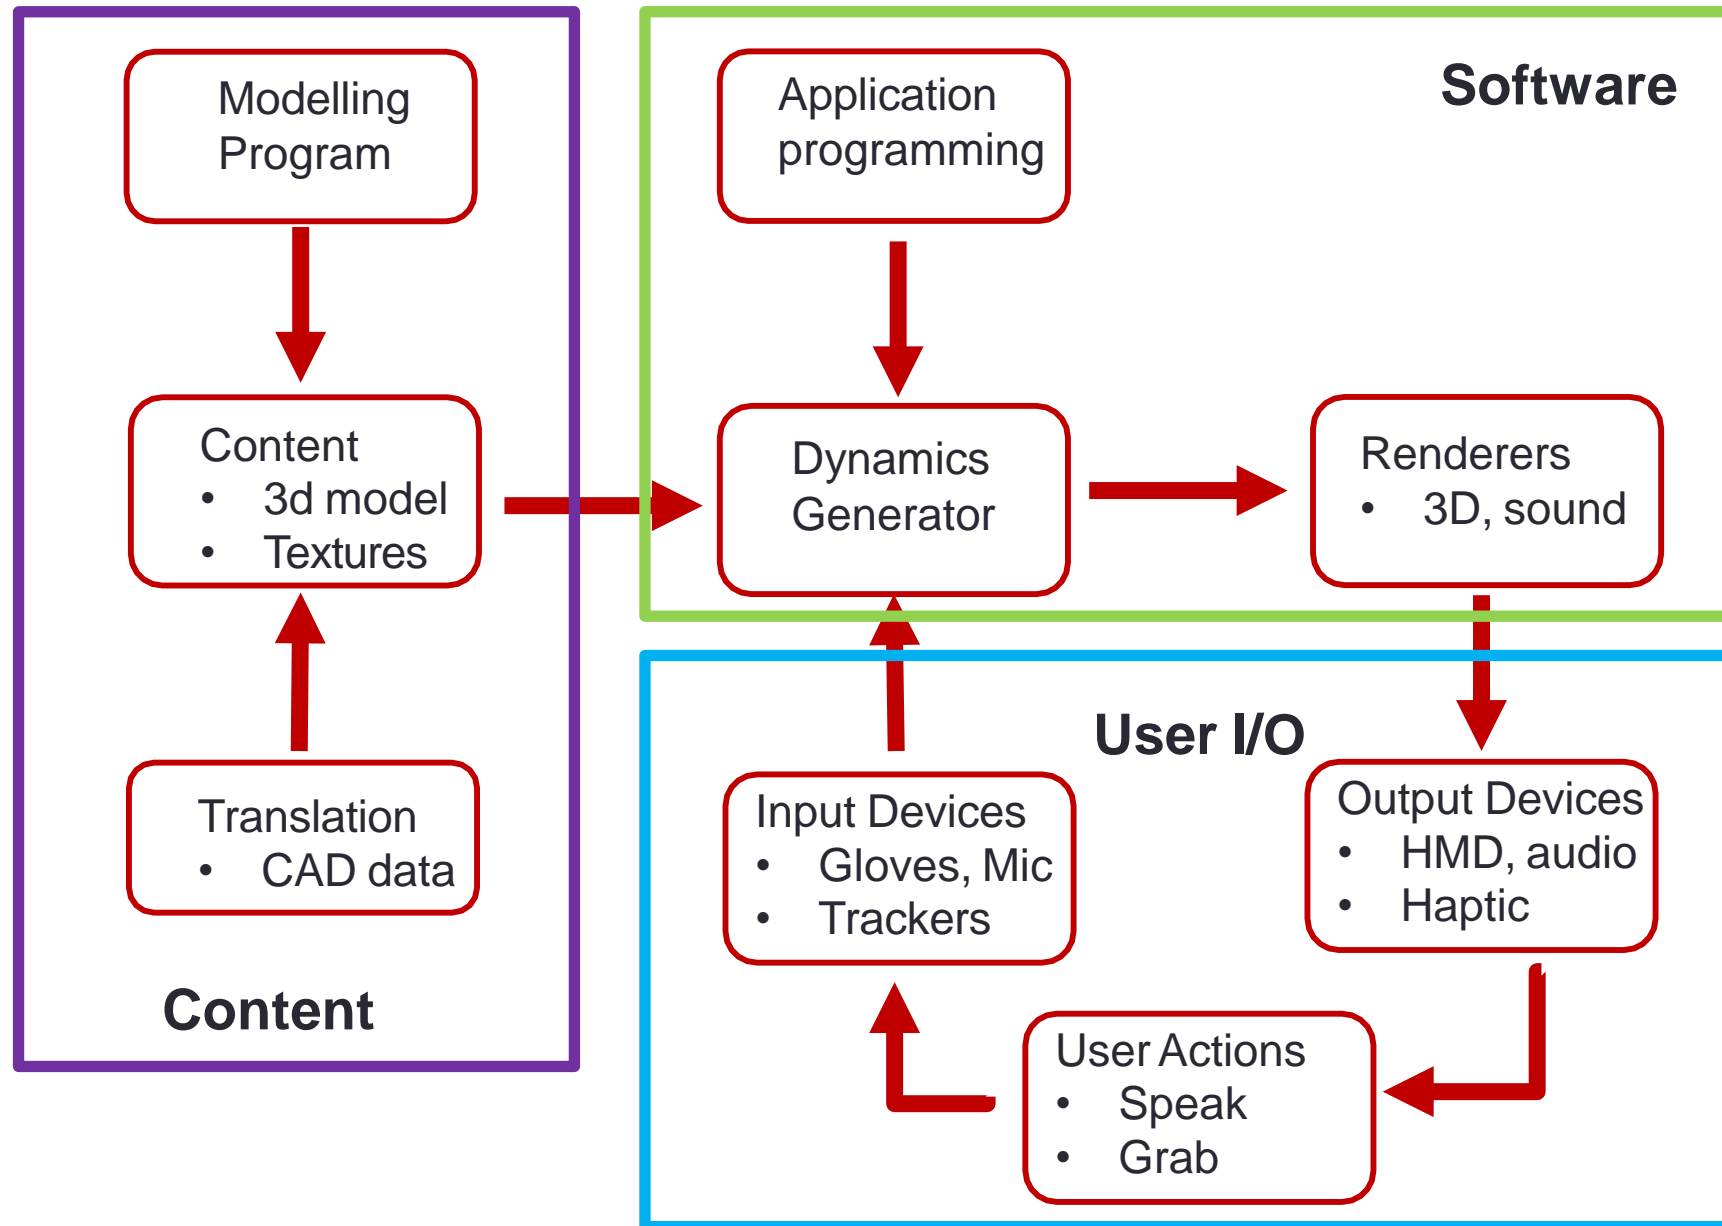

Lecture 4: Recap

- ## VR Input Devices
  - Body, Feet, Handheld, Gestures, Gaze
  - Separate device from Interaction Technique

- ## VR Systems
  - Multiple components
    - Content, Software, User I/O modules
  - VR Simulation Loop
    - System delays cause sickness
  - Reduce system delay
    - Predictive tracking, faster components
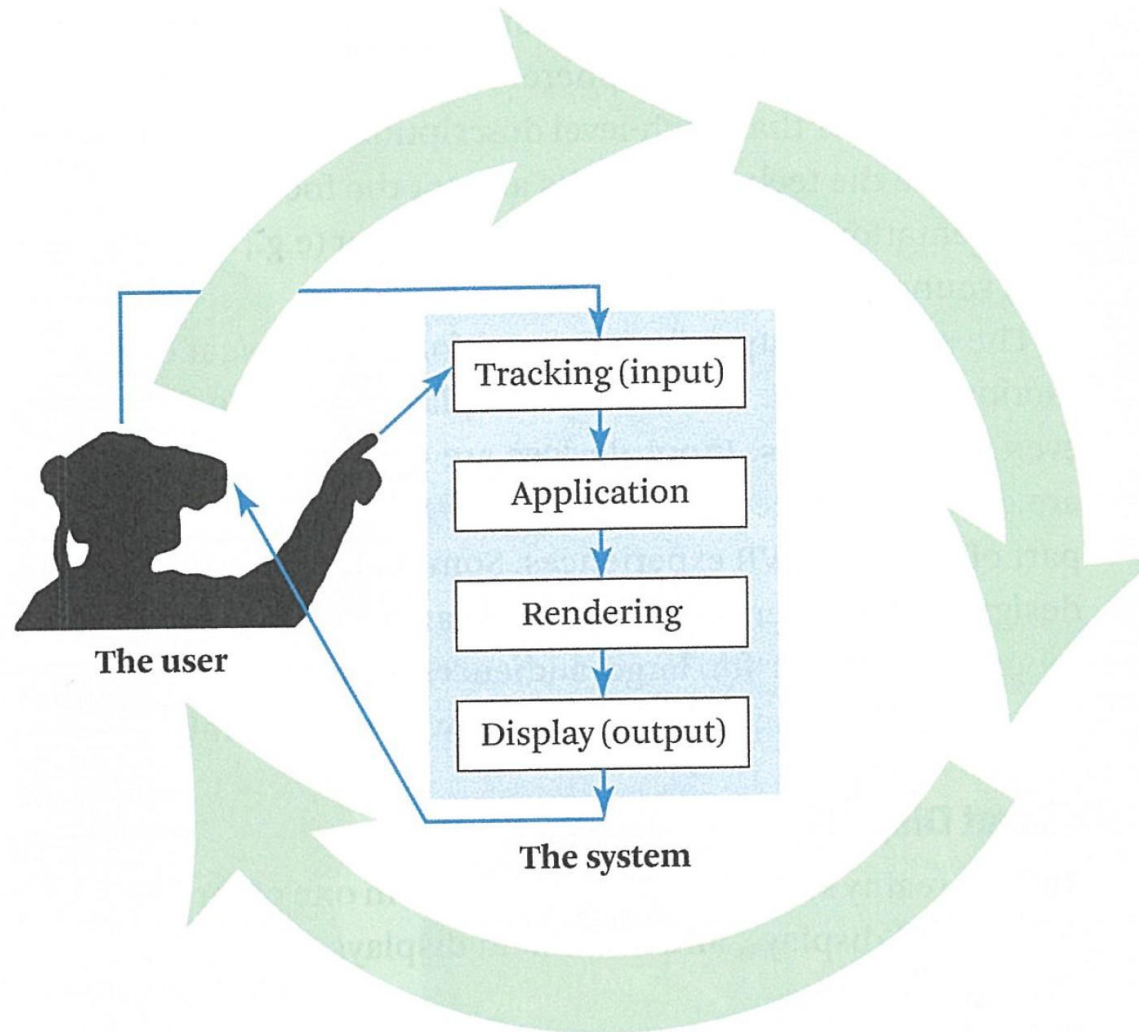

From Content to User

Types of VR Graphics Content

- Panoramas
  - 360 images/video
- Captured 3D content
  - Scanned objects/spaces
- Modelled Content
  - Hand created 3D models
  - Existing 3D assets

Typical VR Simulation Loop

- User moves head, scene updates, displayed graphics change

System Delays

The user

Tracking delay

Application delay

Rendering delay

Display delay

Synchronization delay

The system

- Need to synchronize system to reduce delays

VR System Pipeline
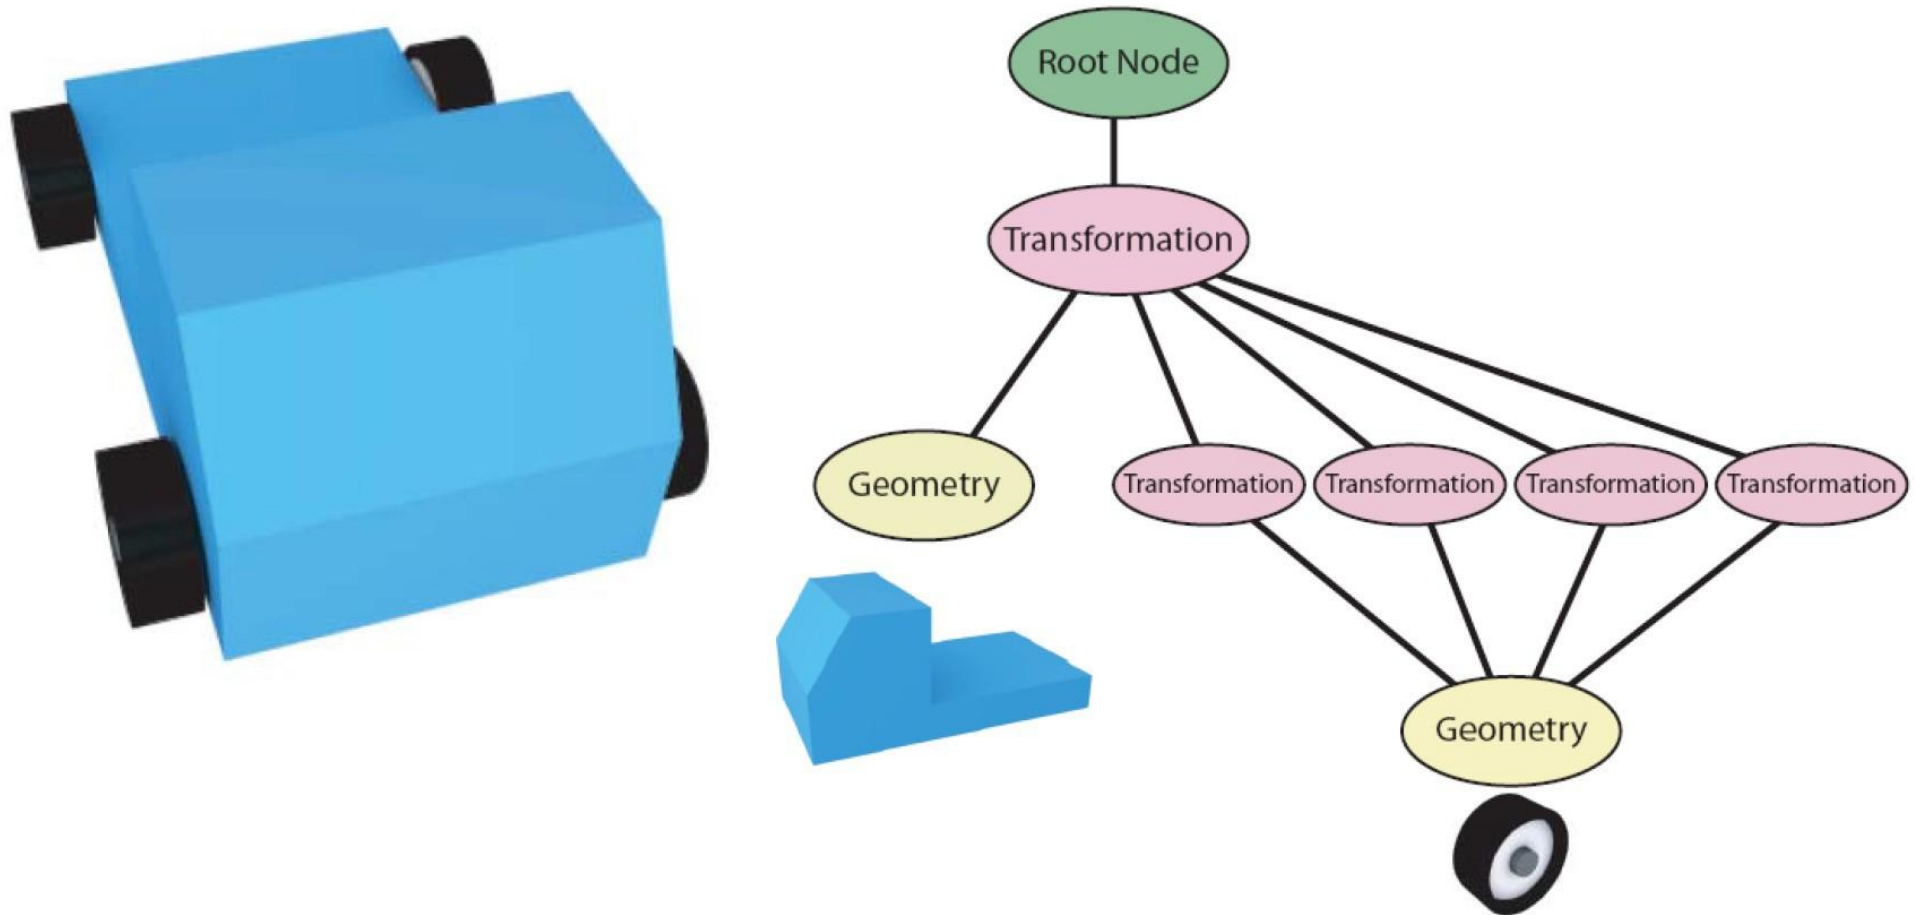

MODERN VR SYSTEM

- Using time warping and lens distortion

Scene Graphs

- Tree-like structure for organising VR graphics
  - e.g. VRML, OSG, X3D
- Hierarchy of nodes that define:
  - Groups (and Switches, Sequences etc…)
  - Transformations
  - Projections
  - Geometry
  - …
- And states and attributes that define:
  - Materials and textures
 - Lighting and blending
  - …

Example Scene Graph

- Car model with four wheels
  - Only need one wheel geometry object in scene graph

INTERACTING IN VR

Typical Virtual Reality System

HMD

User Interface

Input

Tracking

How can we Interact in VR?

- How can VR devices create a natural user experience?

Background: Human-computer interaction

- HCI studies *communication*
  - Users and computers communicate via the interface

- Traditional UI design issues:
  - Input device
  - Interaction style
  - Feedback to the user
  - Gulf of execution / gulf of evaluation

- All these are relevant for 3D/VR User Interfaces

Why 3D Interaction?

- 3D / VR application should be useful
  - Support immersion
  - Use natural skills
  - Provide immediacy of visualization
- But many current VR apps either
  - Support only simple interaction
  - Or, have serious usability problems
- We need good 3D user interface guidelines

# Some Definitions

- ## 3D Interaction:
  - Human-computer interaction in which the user's tasks are carried out in a 3D spatial context
    - 3D input devices, 2D input devices mapping into 3D

- ## 3D user interface (3D UI):
  - A UI that involves 3D interaction

- ## 3D interaction technique:
  - A method (hardware and software) allowing a user to accomplish a task in a 3D UI

Examples of 3D UIs – VR and non-VR

3D physical input, 3D virtual context

3D physical input, 2D virtual context

2D physical input, 3D virtual context

What makes 3D interaction difficult?

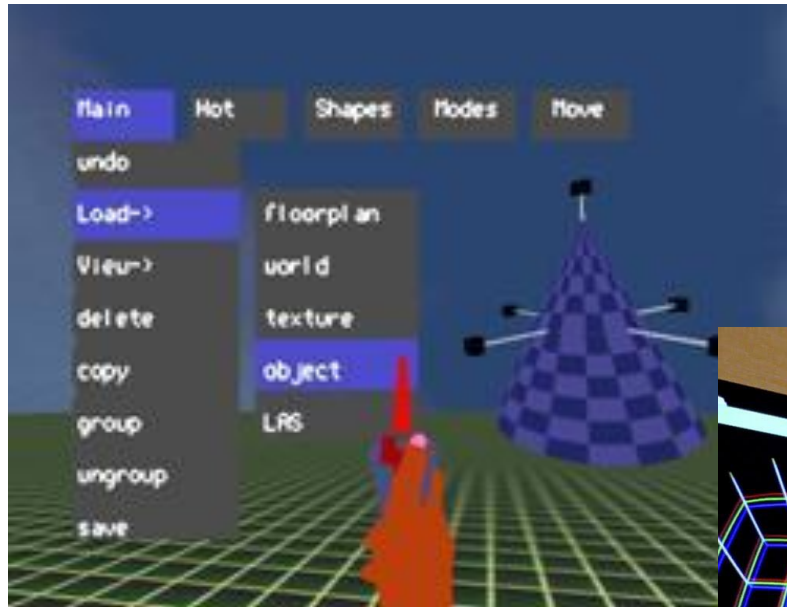

- Spatial input
- Lack of constraints
- Lack of standards
- Lack of tools

- Lack of precision
- Fatigue
- Layout more complex
- Perception

Example: Virtual-SAP

World Builder Today (Available on Steam)

- https://www.youtube.com/watch?v=65u3W7wjXs0
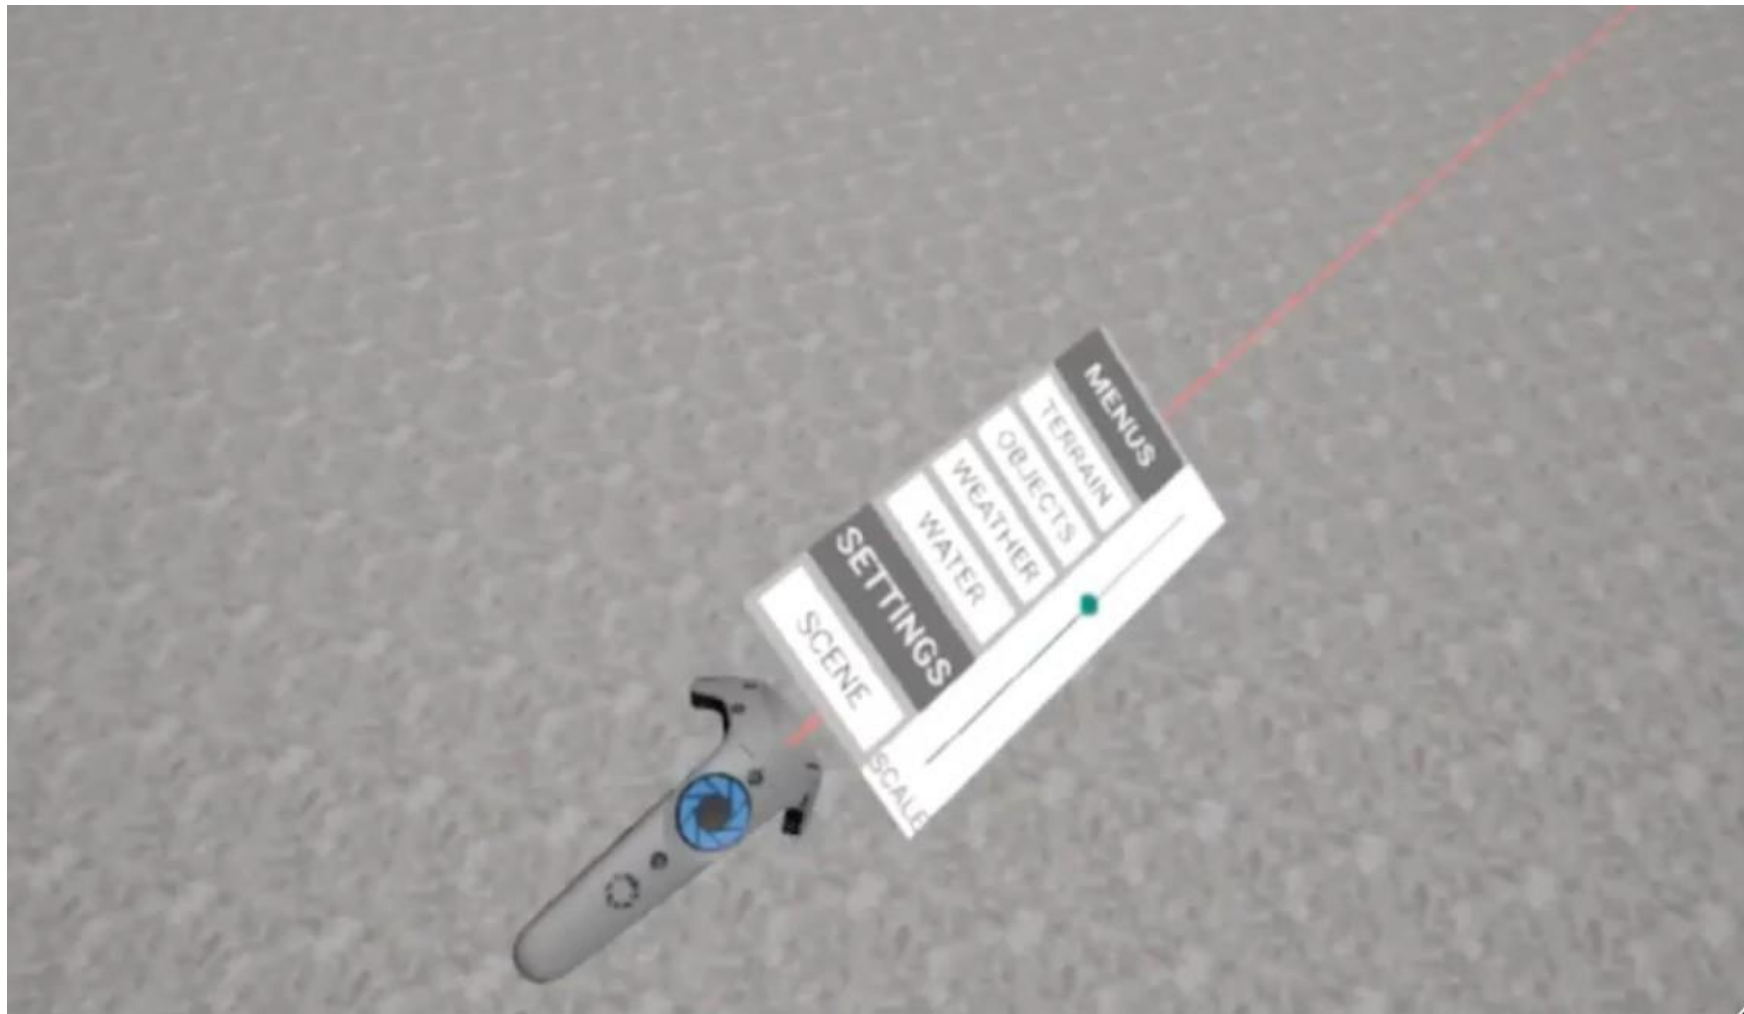

Vision vs. Reality – Still Work to Do..

Natural interface
Gesture, speech
Wide field of view
Full body input

Limited input
Wireless, limited range tracking
Reduced field of view
2D GUI in VR

Universal 3D Interaction Tasks in VR

- Object Interaction
    - *Selection:* Picking object(s) from a set
    - *Manipulation:* Modifying object properties

- Navigation
    - *Travel:* motor component of viewpoint motion
    - *Wayfinding:* cognitive component; decision-making

- System control
    - Issuing a command to change system state or mode

OBJECT INTERACTION

Selection and Manipulation

- ## Selection:
  - specifying one or more objects from a set
- ## Manipulation:
  - modifying object properties
    - <u>position</u>, <u>orientation</u>, scale, shape, color, texture, behavior, etc.
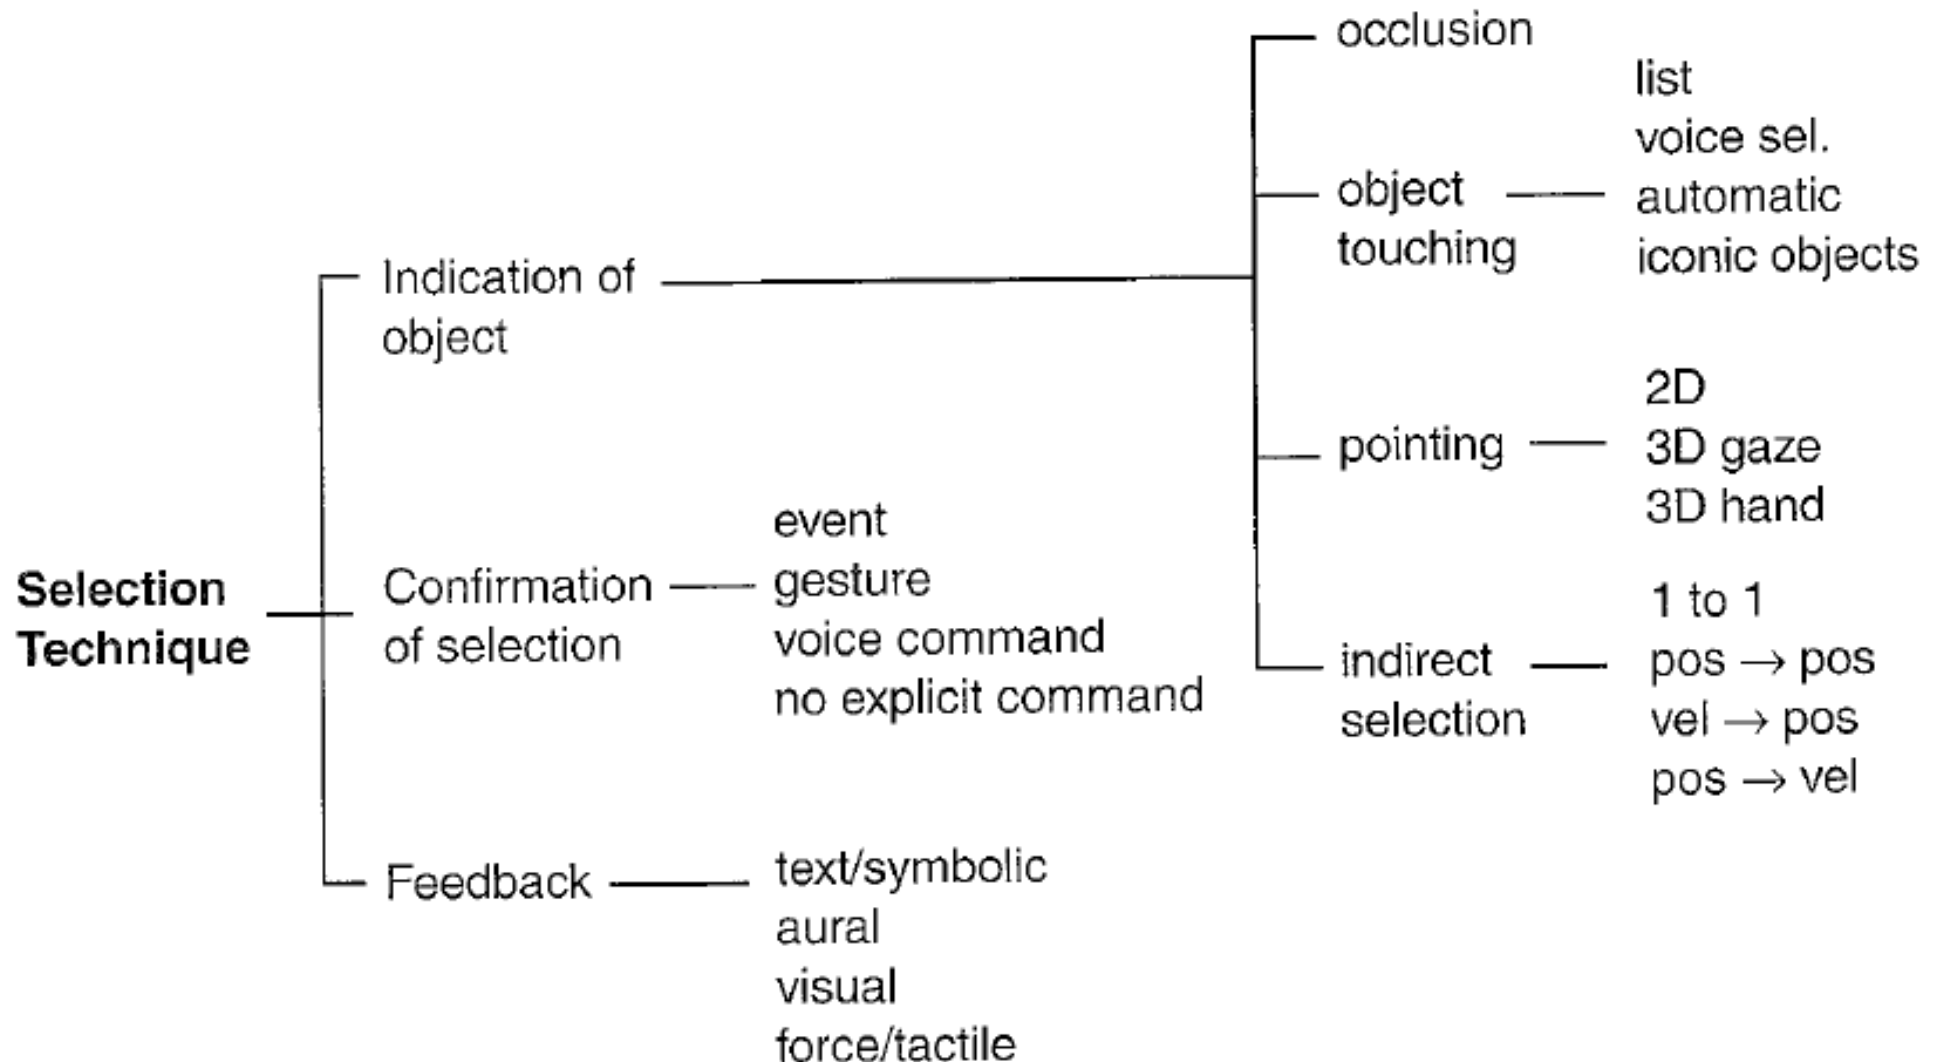

Goals of selection

- Indicate action on object
- Query object
- Make object active
- Travel to object location
- Set up manipulation

Selection performance

- Variables affecting user performance
  - Object distance from user
  - Object (visual) size
  - Density of objects in area
  - Occluders

Classification of Selection Techniques

Selection classification

Selection
- Feedback
  - graphical
  - tactile
  - audio
- Object indication
  - object touching
  - pointing
  - indirect selection
- Indication to select
  - button
  - gesture
  - voice
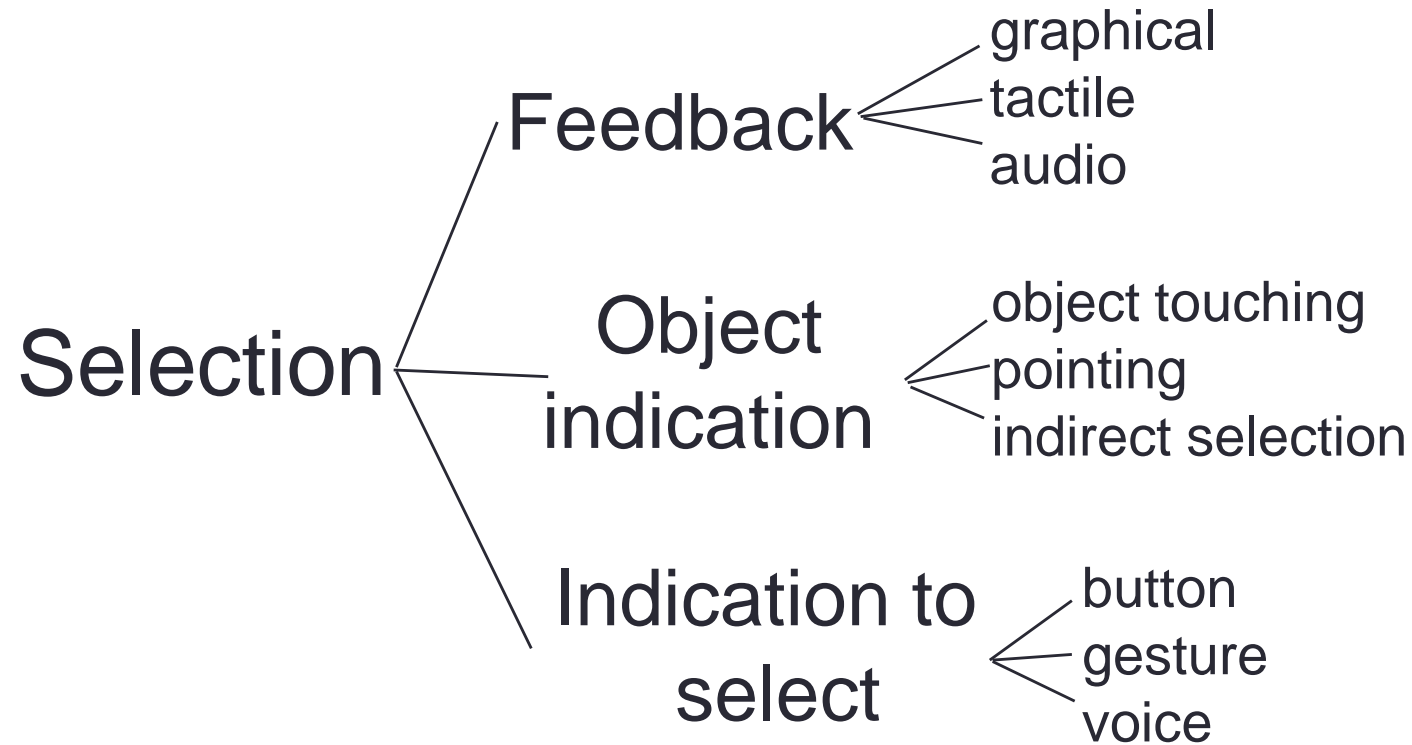

Common Selection Techniques

- Simple virtual hand
- Ray-casting
- Occlusion
- Go-go (arm-extension)

Simple virtual hand technique

- Process
 - One-to-one mapping between physical and virtual hands
  - Object can be selected by "touching" with virtual hand
  - "Natural" mapping
- Limitation:
  - Only select objects in hand reach

Ray-casting technique

- "Laser pointer" attached to virtual hand
  - First object intersected by ray may be selected
  - User only needs to control 2 DOFs
- Proven to perform well for remote selection
- Variants:
  - Cone casting
  - Snap-to-object rays

Example Ray Casting

- https://www.youtube.com/watch?v=W1ZUBTPCL3E
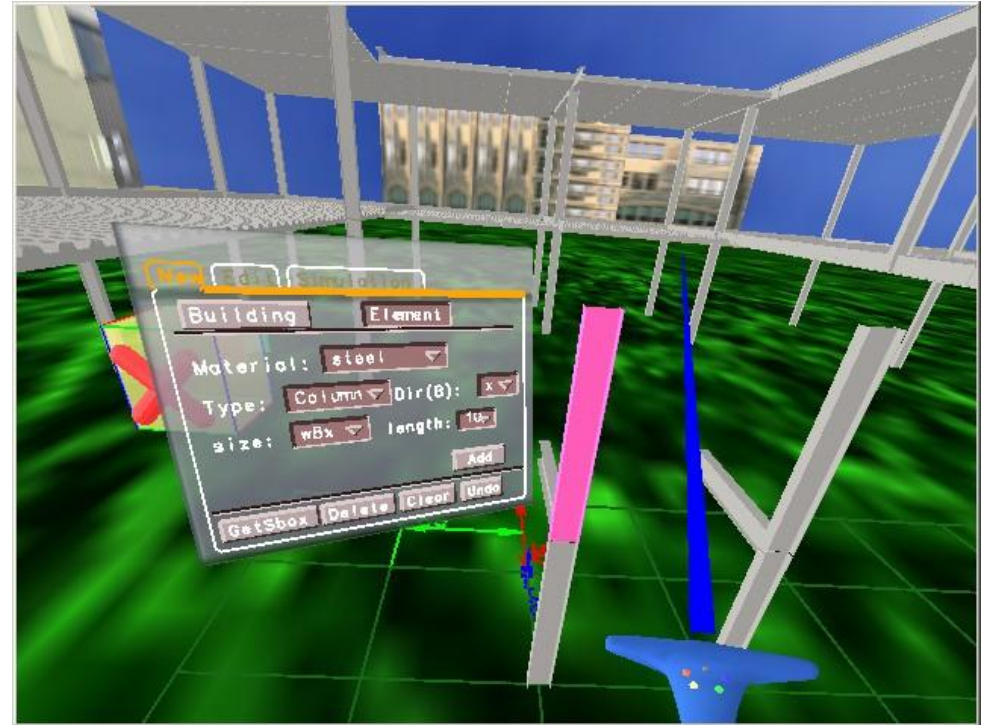

Occlusion technique

- Image-plane technique - truly 2D
- Occlude/cover desired object with selector object (e.g. finger)
- Nearest object along ray from eye through finger may be selected

Image Plane Interaction

Target virtual object

User view
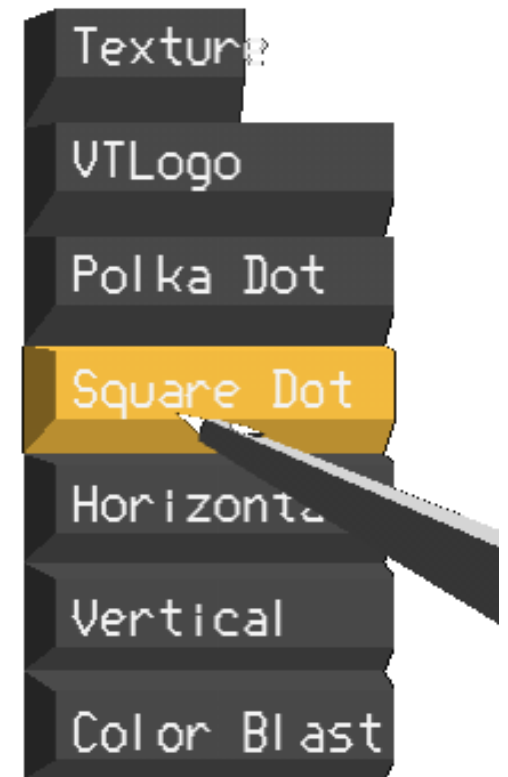

- Pierce, J., Forsberg, A., Conway, M., Hong, S., Zeleznik, R., & Mine, M. (1997). *Image Plane Interaction Techniques in 3D Immersive Environments.* Proceedings of the ACM Symposium on Interactive 3D Graphics, 39-44.

Example

- https://www.youtube.com/watch?v=DBPkE9wsqIY
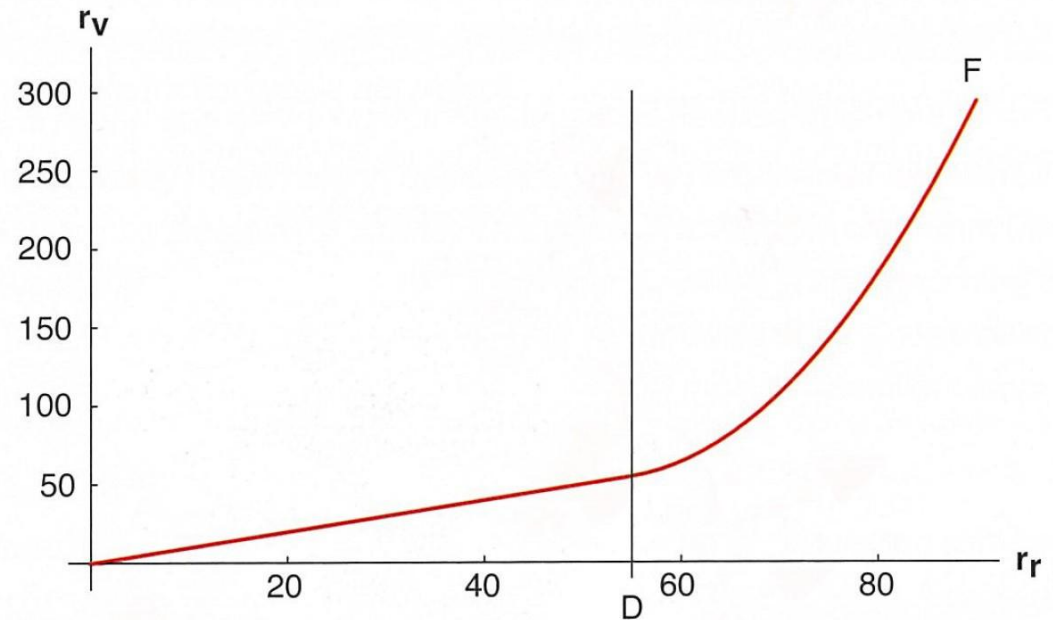

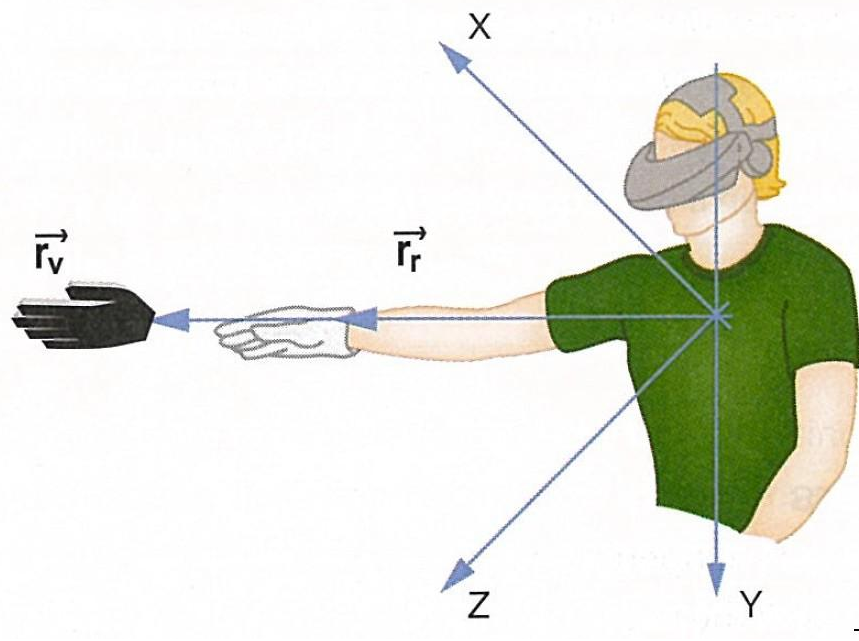

Go-Go Technique

- Arm-extension technique
- Non-linear mapping between physical and virtual hand position
- Local and distant regions (linear < D, non-linear > D)

Poupyrev, I., Billinghurst, M., Weghorst, S., & Ichikawa, T. (1996). The Go-Go Interaction Technique: Non-linear Mapping for Direct Manipulation in VR. *Proceedings of the ACM Symposium on User Interface Software and Technology,* 79-80.

Precise 3D selection techniques

- Increase selection area
  - Cone-casting (Liang, 1993)
  - Snapping (de Haan, 2005)
  - 3D Bubble Cursor (Vanacken, 2007)
 - Sphere-casting (Kopper 2011)

Not ideal for cluttered environments (high density, occlusion)

- Increase control/display ratio
  - PRISM (Frees, 2007)
  - ARM (Kopper, 2010)

May require careful interaction

Cone-Casting

Spotlight

from/eye point

aperture circle

conic volume
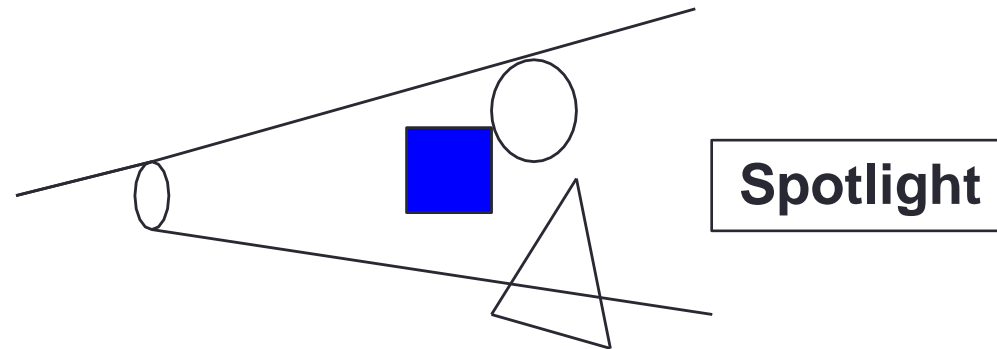

Aperture

Sphere-casting (SQUAD)

- Two phases
  - Sphere-casting followed by QUAD-menu selection

- Features
  - Multiple low precision selections
  - Scales well – at most $\log_4 n+1$ refinement steps

- Limitations
  - Quad-menu phase is done outside spatial context
  - Target needs to be unique or selectable among identical ones

Kopper, R., Bacim, F., & Bowman, D. A. (2011). Rapid and accurate 3D selection by progressive refinement. In *3D User Interfaces (3DUI), 2011 IEEE Symposium on* (pp. 67-74). IEEE.

SQUAD Selection

Sphere casting
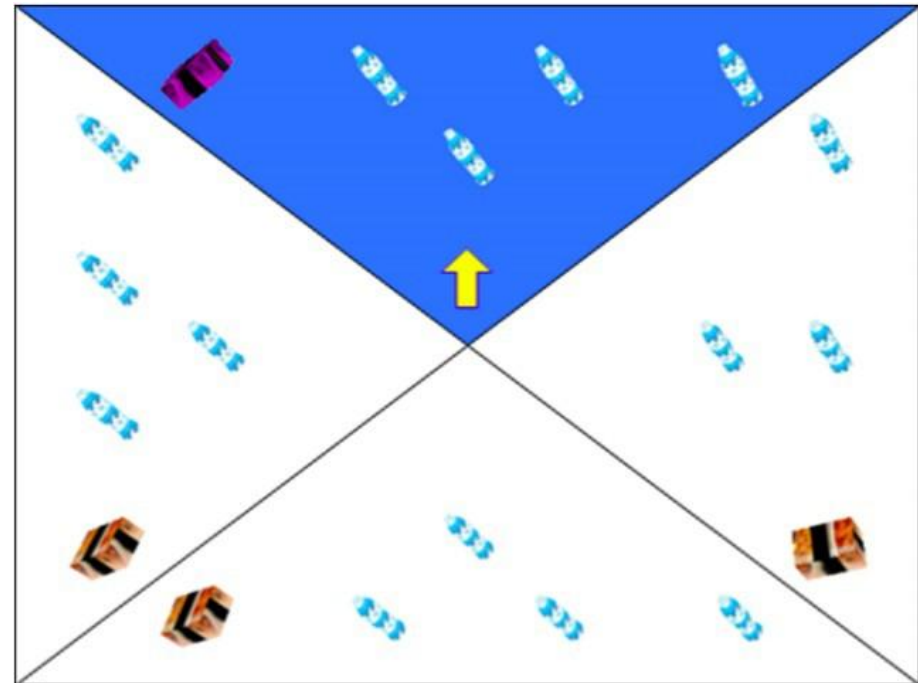

Quad Selection

Example: SQUAD Selection

https://www.youtube.com/watch?v=e-4SaOTxf5Y
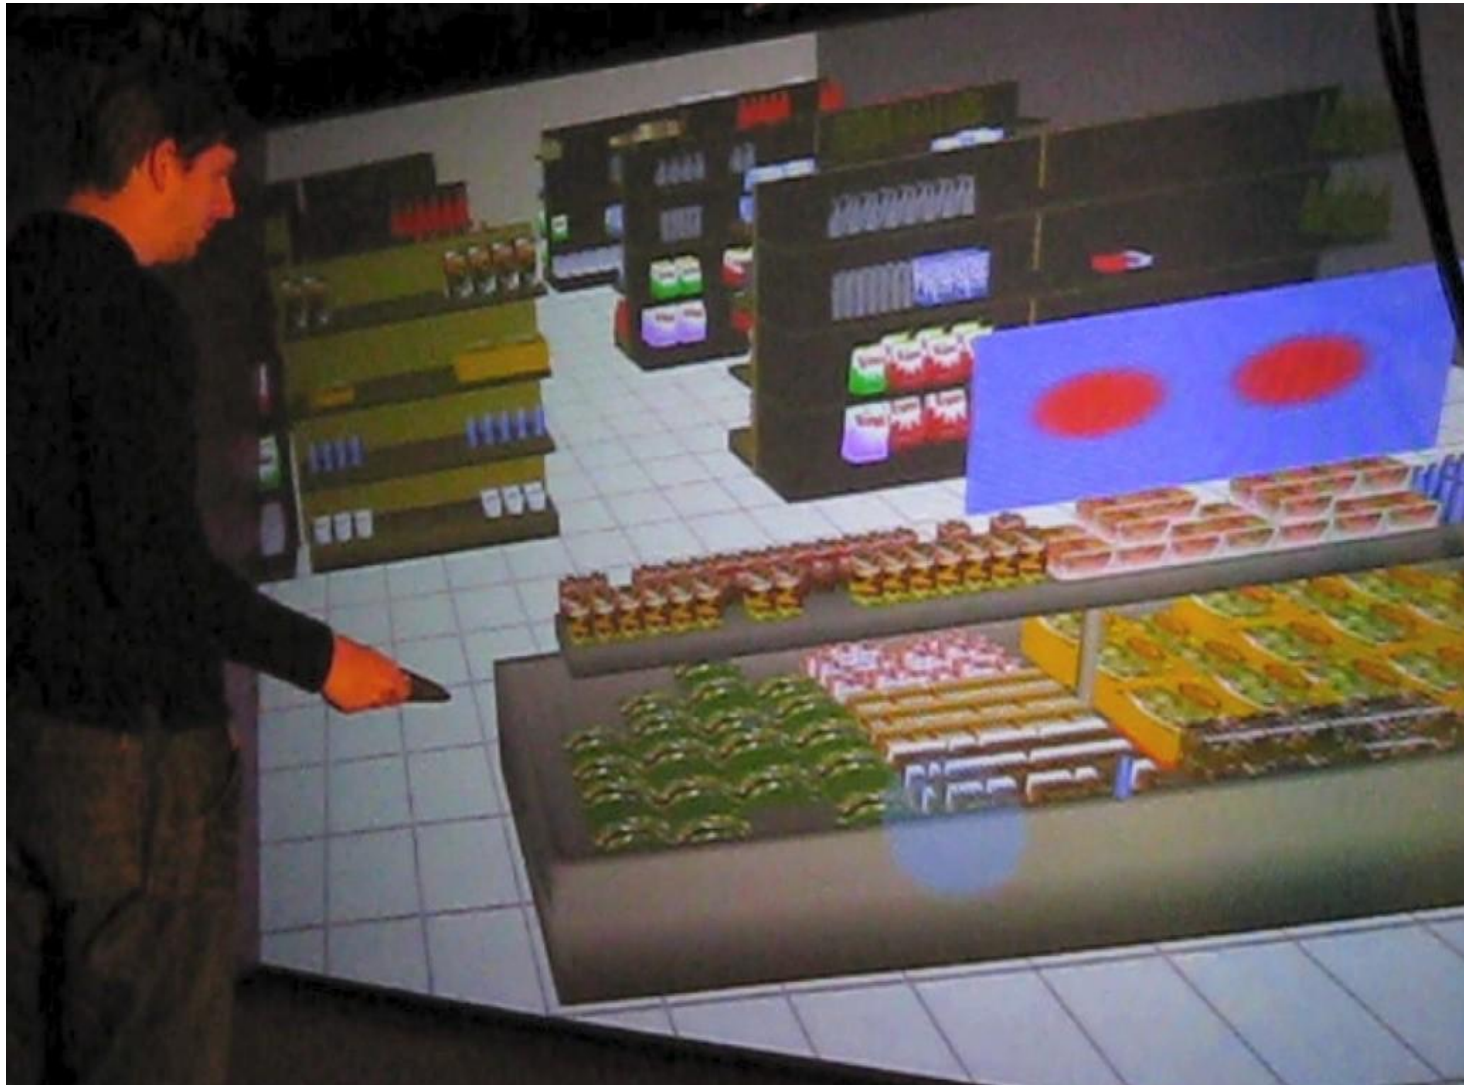

PRISM (Frees 2005)

- Change Control/Gain ratio based on hand speed
  - As hand moves slower, scale down object motion
  - As hand moves faster, us 1:1 motion mapping

$$D_{object} = min(V_{hand} / SC, 1) * D_{hand}$$

- Twice the performance for object docking tasks
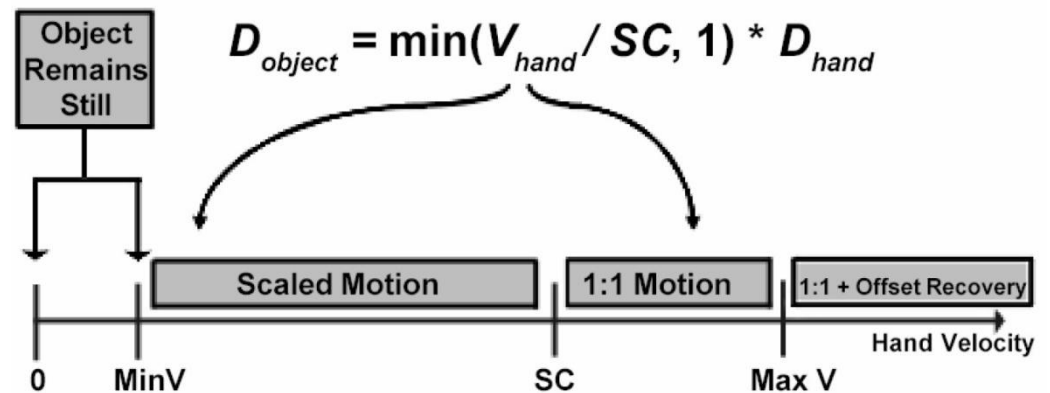

Frees, S., & Kessler, G. D. (2005). Precise and rapid interaction through scaled manipulation in immersive virtual environments. In *Virtual Reality, 2005. Proceedings. VR 2005. IEEE* (pp. 99-106).

Goals of manipulation

- Object placement
  - Design
  - Layout
  - Grouping
- Tool usage
- Travel
Classification of Manipulation Techniques
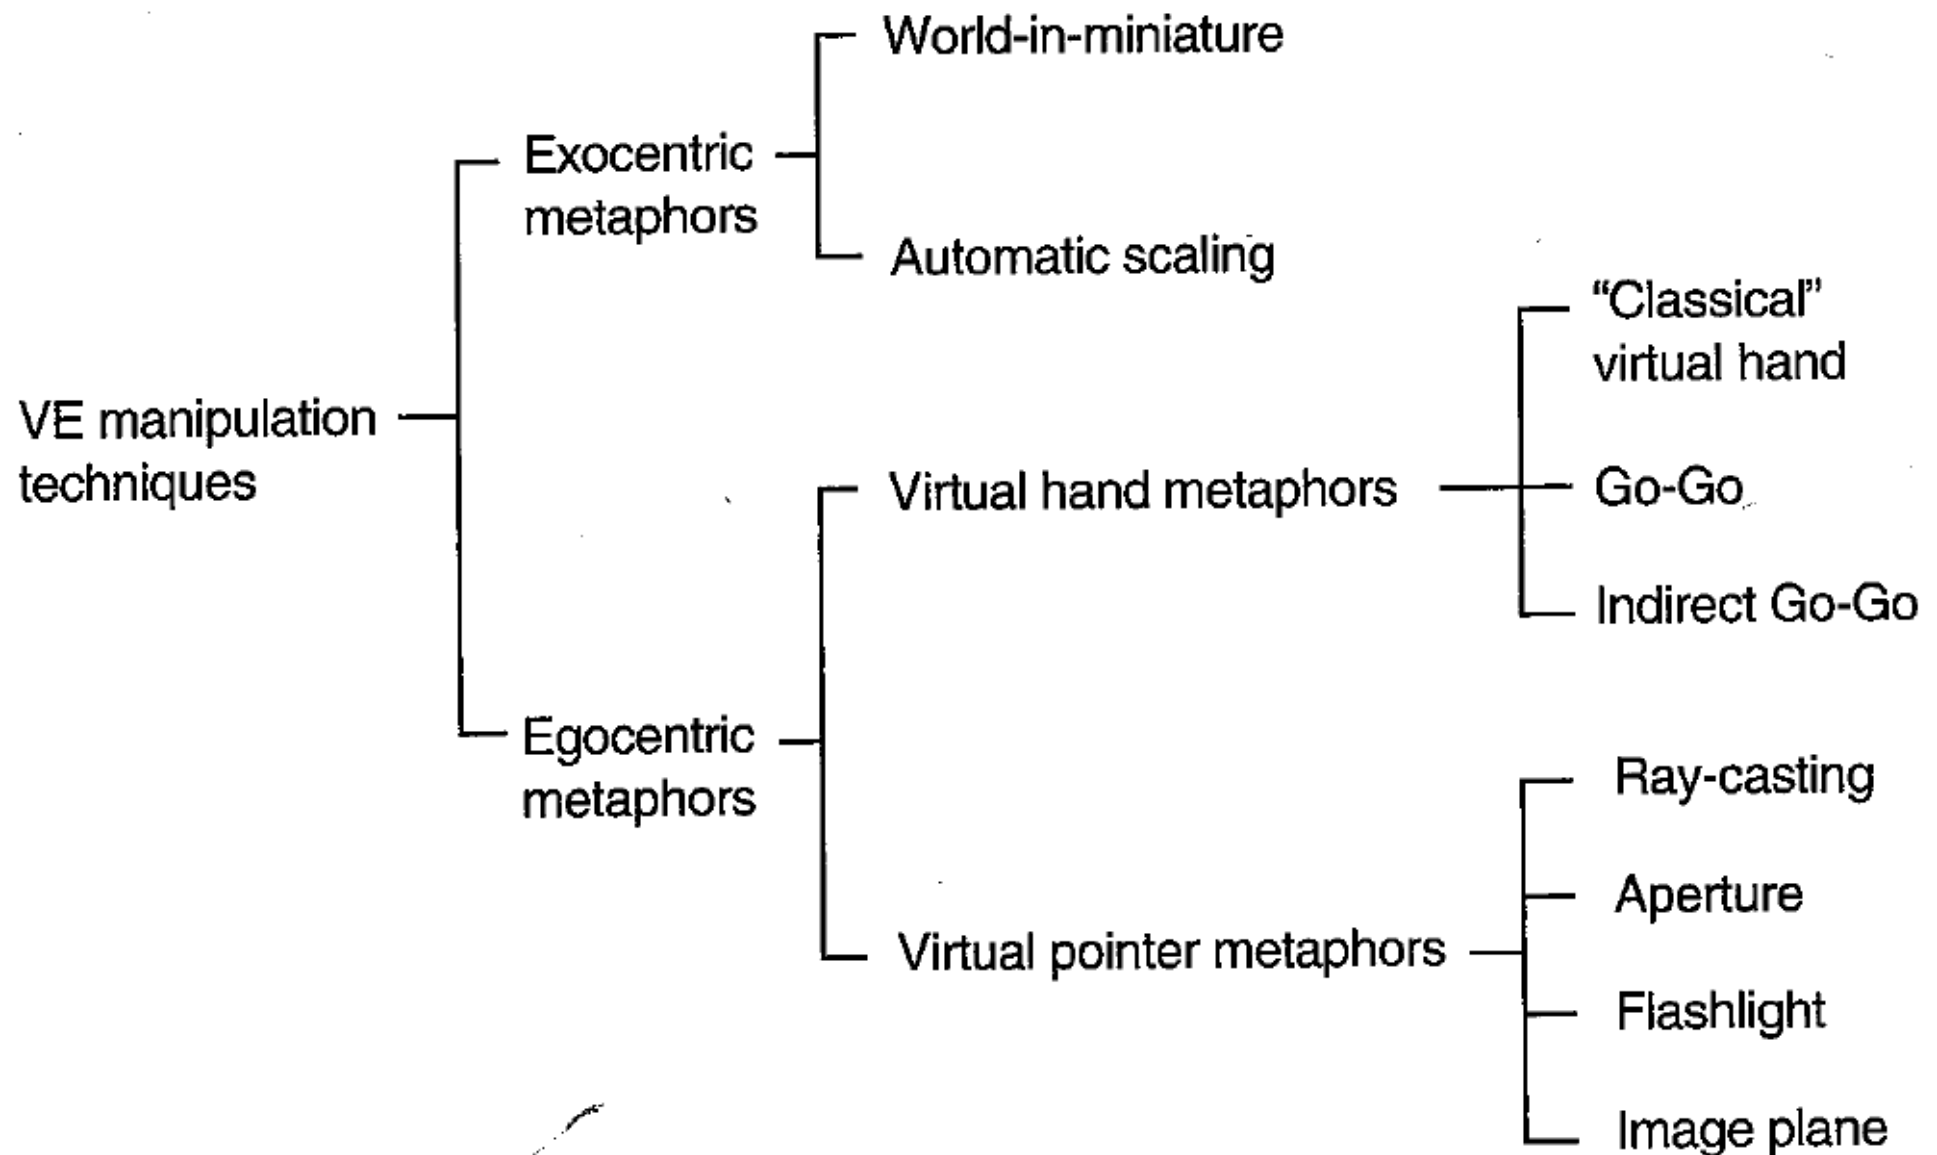

Technique Classification by Components

Manipulation
- Object Attachment
  - attach to hand
  - attach to gaze
  - hand moves to object
  - object moves to hand
  - user/object scaling
- Object Position
  - no control
  - 1-to-N hand to object motion
  - maintain body-hand relation
  - other hand mappings
  - indirect control
- Object Orientation
  - no control
  - 1-to-N hand to object rotation
  - other hand mappings
  - indirect control
- Feedback
  - graphical
  - force/tactile
  - audio

Common Manipulation Techniques

- Simple virtual hand
- HOMER
- Scaled-world grab
- World-in-miniature

Simple Virtual Hand Manipulation

https://www.youtube.com/watch?v=_OgfREa4ggw
HOMER technique

Hand-Centered

Object

Manipulation

Extending

Ray-Casting

Time

- Selection: ray-casting

- Manipulate: directly with virtual hand

- Include linear mapping to allow wider range of placement in depth
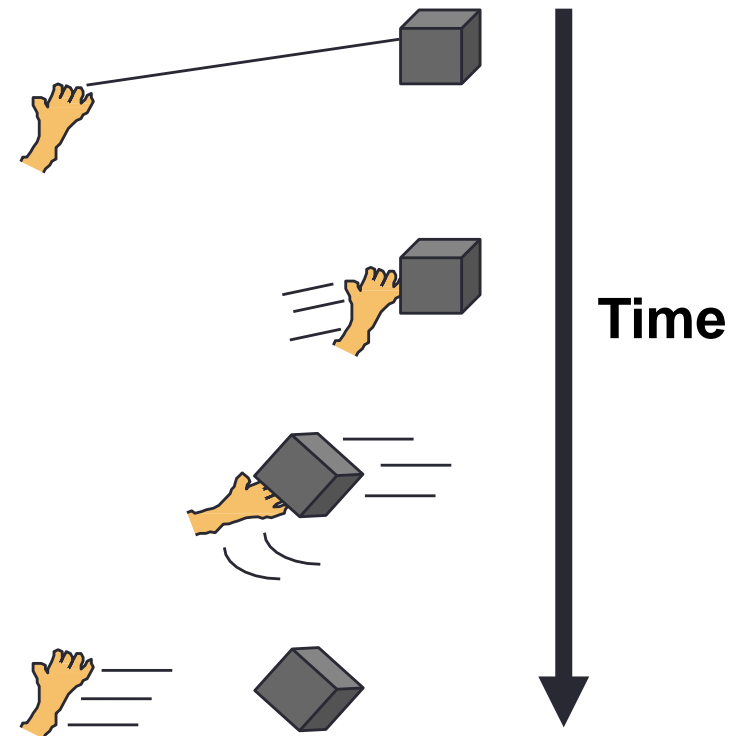

Bowman, D., & Hodges, L. (1997). *An Evaluation of Techniques for Grabbing and Manipulating Remote Objects in Immersive Virtual Environments.* Proceedings of the ACM Symposium on Interactive 3D Graphics, 35-38.

Example

- https://www.youtube.com/watch?v=V6Fo3iza5cY
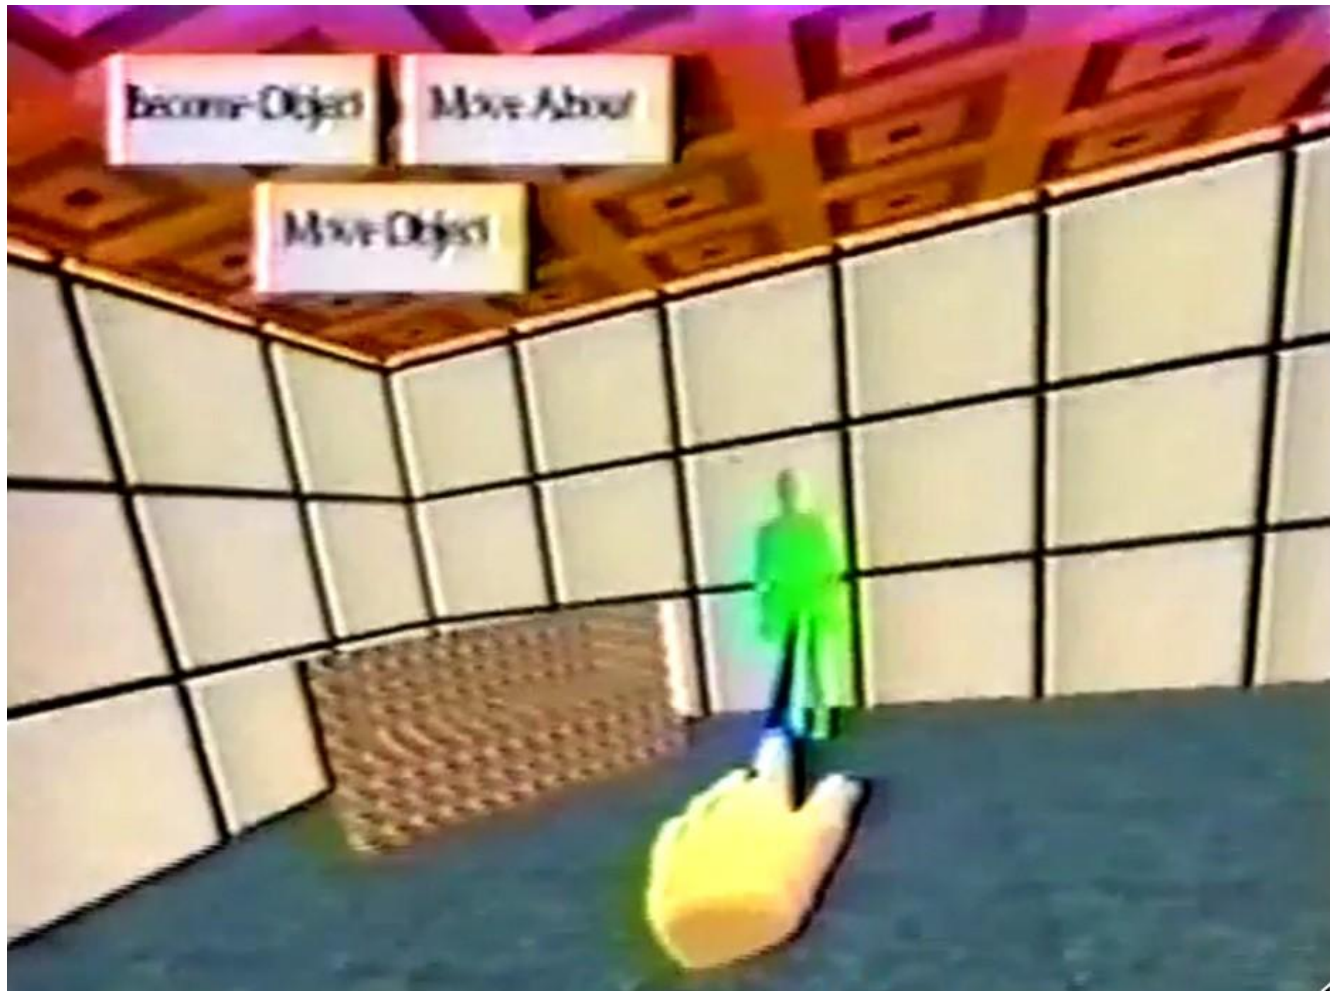

Scaled-world Grab Technique

- Often used w/ occlusion
- At selection, scale user up (or world down) so that virtual hand is actually touching selected object
- User doesn't notice a change in the image until he moves

1) Select 2) Grab 3) Manipulate 4) Release
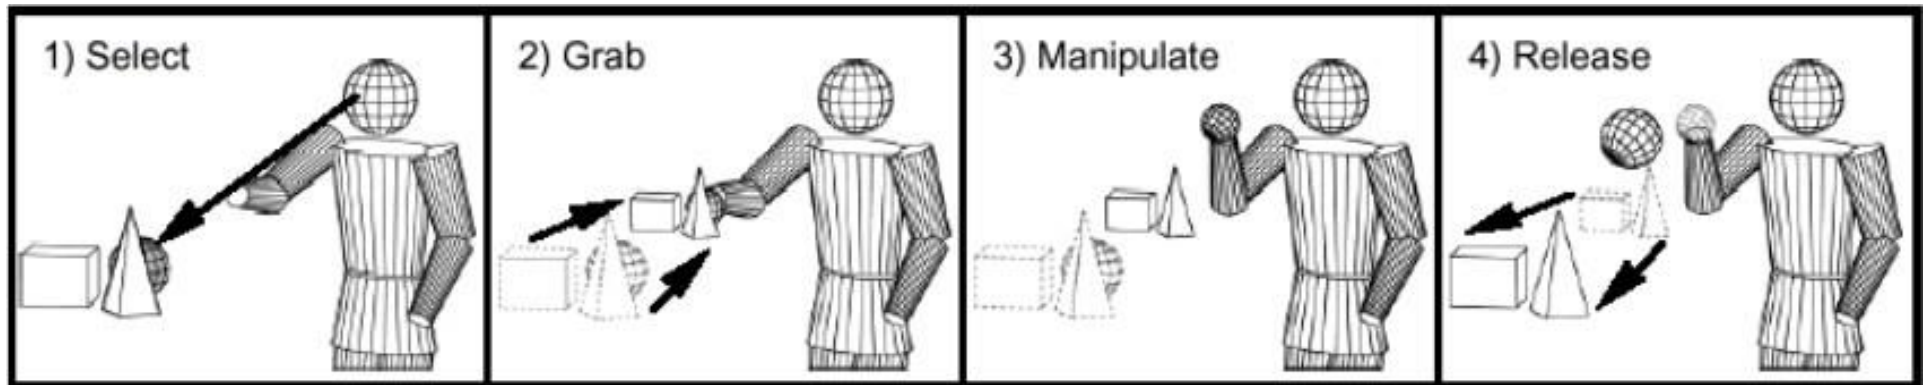

Mine, M., Brooks, F., & Sequin, C. (1997). *Moving Objects in Space: Exploiting Proprioception in Virtual Environment Interaction.* Proceedings of ACM SIGGRAPH, 19-26

World-in-miniature (WIM) technique

- "Dollhouse" world held in user's hand
- Miniature objects can be manipulated directly
- Moving miniature objects affects full-scale objects
- Can also be used for navigation
Stoakley, R., Conway, M., & Pausch, R. (1995). *Virtual Reality on a WIM: Interactive Worlds in Miniature.* Proceedings of CHI: Human Factors in Computing Systems, 265-272, and Pausch, R., Burnette, T., Brockway, D., & Weiblen, M. (1995). *Navigation and Locomotion in Virtual Worlds via Flight into Hand-Held Miniatures.* Proceedings of ACM SIGGRAPH, 399-400.

https://www.youtube.com/watch?v=Ytc3ix-He4E
Voodoo Doll Interaction

- Manipulate miniature objects
  - Act on copy of objects
  - Actions duplicated on actual object
  - Supports action at a distance

- Two handed technique
  - One hand sets stationary reference frame
  - Second hand manipulates object
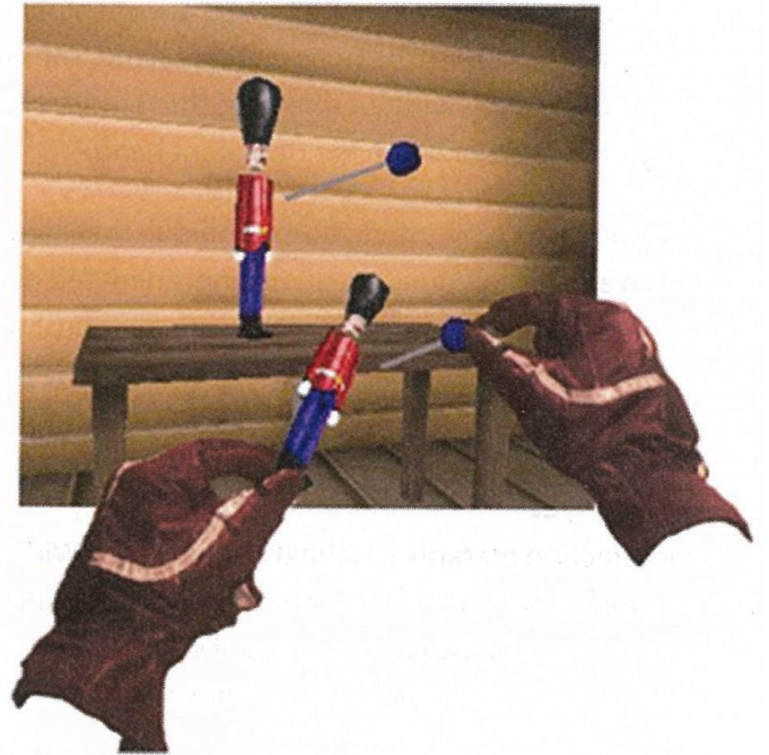

Pierce, J. S., Stearns, B. C., & Pausch, R. (1999). Voodoo dolls: seamless interaction at multiple scales in virtual environments. In *Proceedings of the 1999 symposium on Interactive 3D graphics* (pp. 141-145). ACM.

Two-Handed Interaction

- **Symmetric vs. Asymmetric**
    - Symmetric: both hands performing same actions
    - Asymmetric: both hands performing different actions

- **Dominant (D) vs. non-dominant (ND) hand**
    - Guiard's principles
    - ND hand provides frame of reference
    - ND hand used for coarse tasks, D hand for fine-grained tasks
    - Manipulation initiated by ND hand

Guiard, Y., "Asymmetric Division of Labor in Human Skilled Bimanual Action: The Kinematic Chain as a Model," *J. Motor Behavior*, 19 (4), 1987, pp. 486-517.

Symmetric Bimanual Technique

(a) Shortest distance between rays — Point of interaction

(b) New point
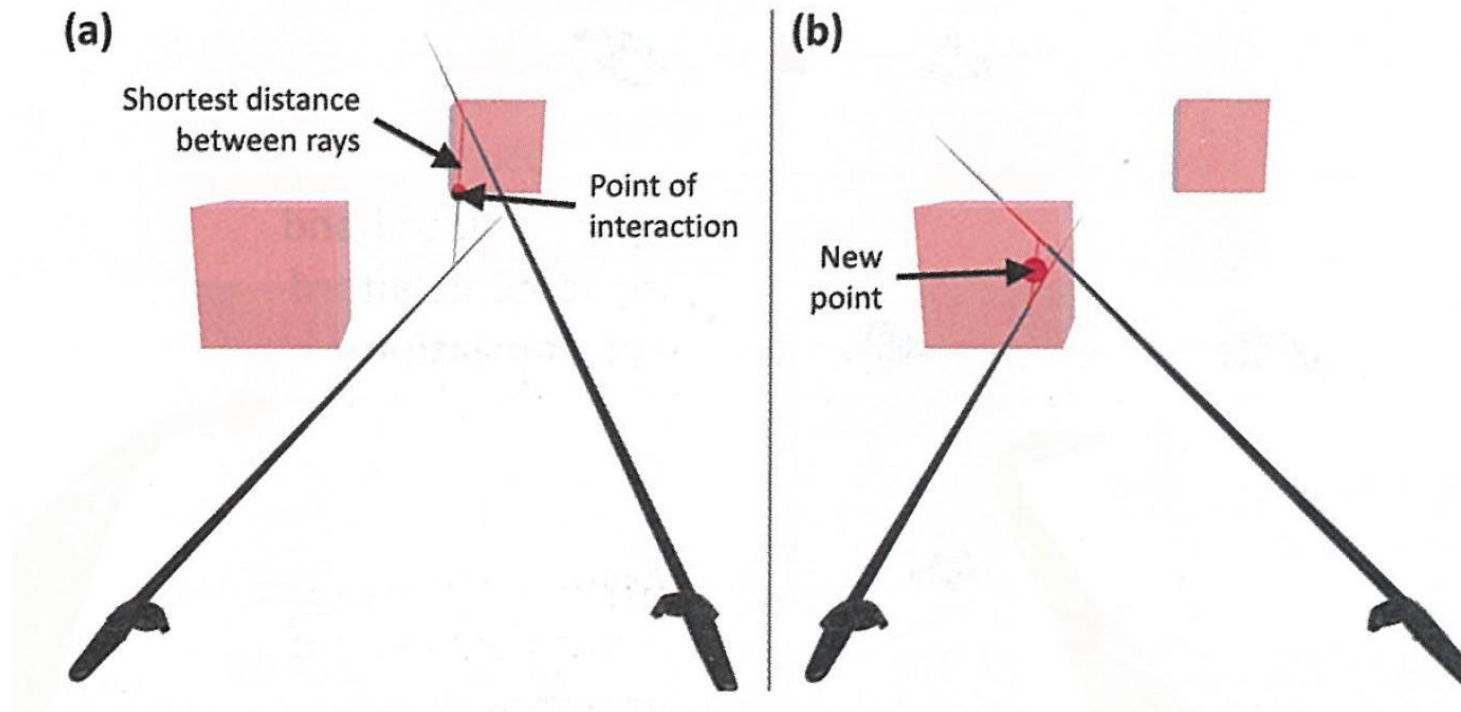

- iSith (Wyss 2006)
- Using two 6 DOF controllers each ray casting
- Intersection point of two rays determines interaction point

Wyss, H. P., Blach, R., & Bues, M. (2006, March). iSith-Intersection-based spatial interaction for two hands. In *3D User Interfaces, 2006. 3DUI 2006. IEEE Symposium on* (pp. 59-61). IEEE.

Asymmetric Bimanual Technique

- Spindle + Wheel (Cho 2015)
- Two 6 DOF handheld controls
  - One dominant, one ND
- Movement one hand relative to other provides 7 DOF input

Synchronized hand movements afford **xyz translations**

Asymmetric hand movements afford **yz rotations**

Dominant-hand pitches afford **x rotations**

Hand separations afford **scaling**
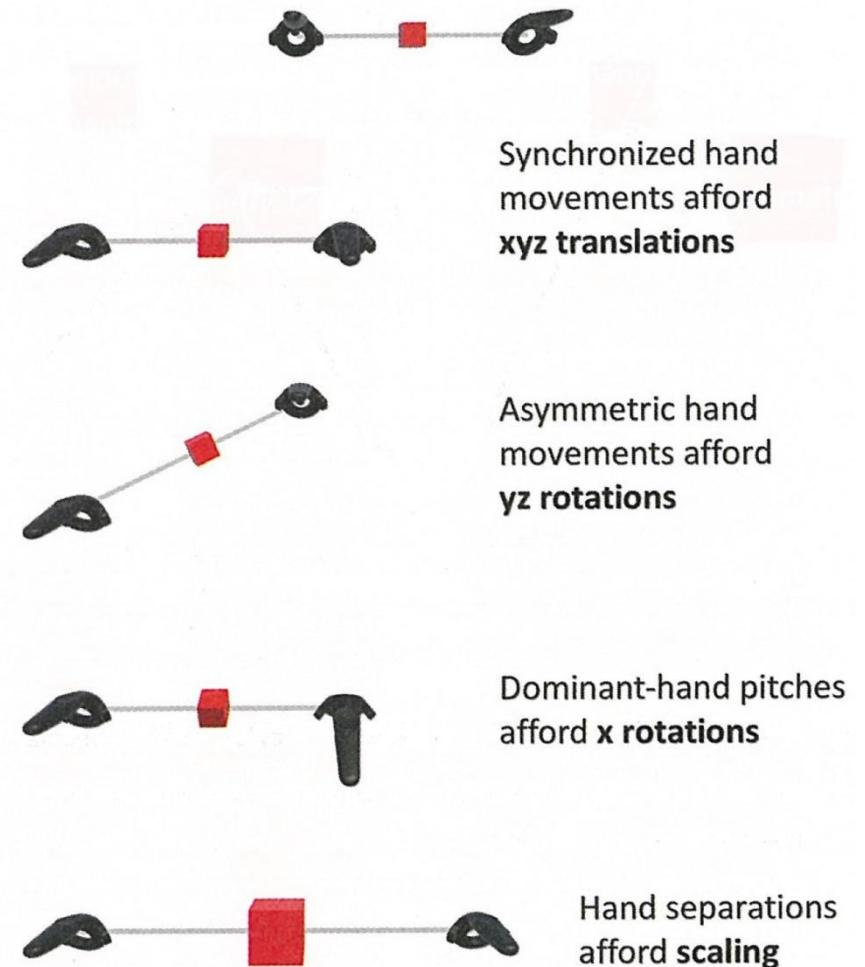

Cho, I., & Wartell, Z. (2015). Evaluation of a bimanual simultaneous 7DOF interaction technique in virtual environments. In *3D User Interfaces, 2015 IEEE Symposium on* (pp. 133-136). IEEE.

Demo: Spindle + Wheel 7 DOF Input

- https://www.youtube.com/watch?v=nF4egFHyLYM
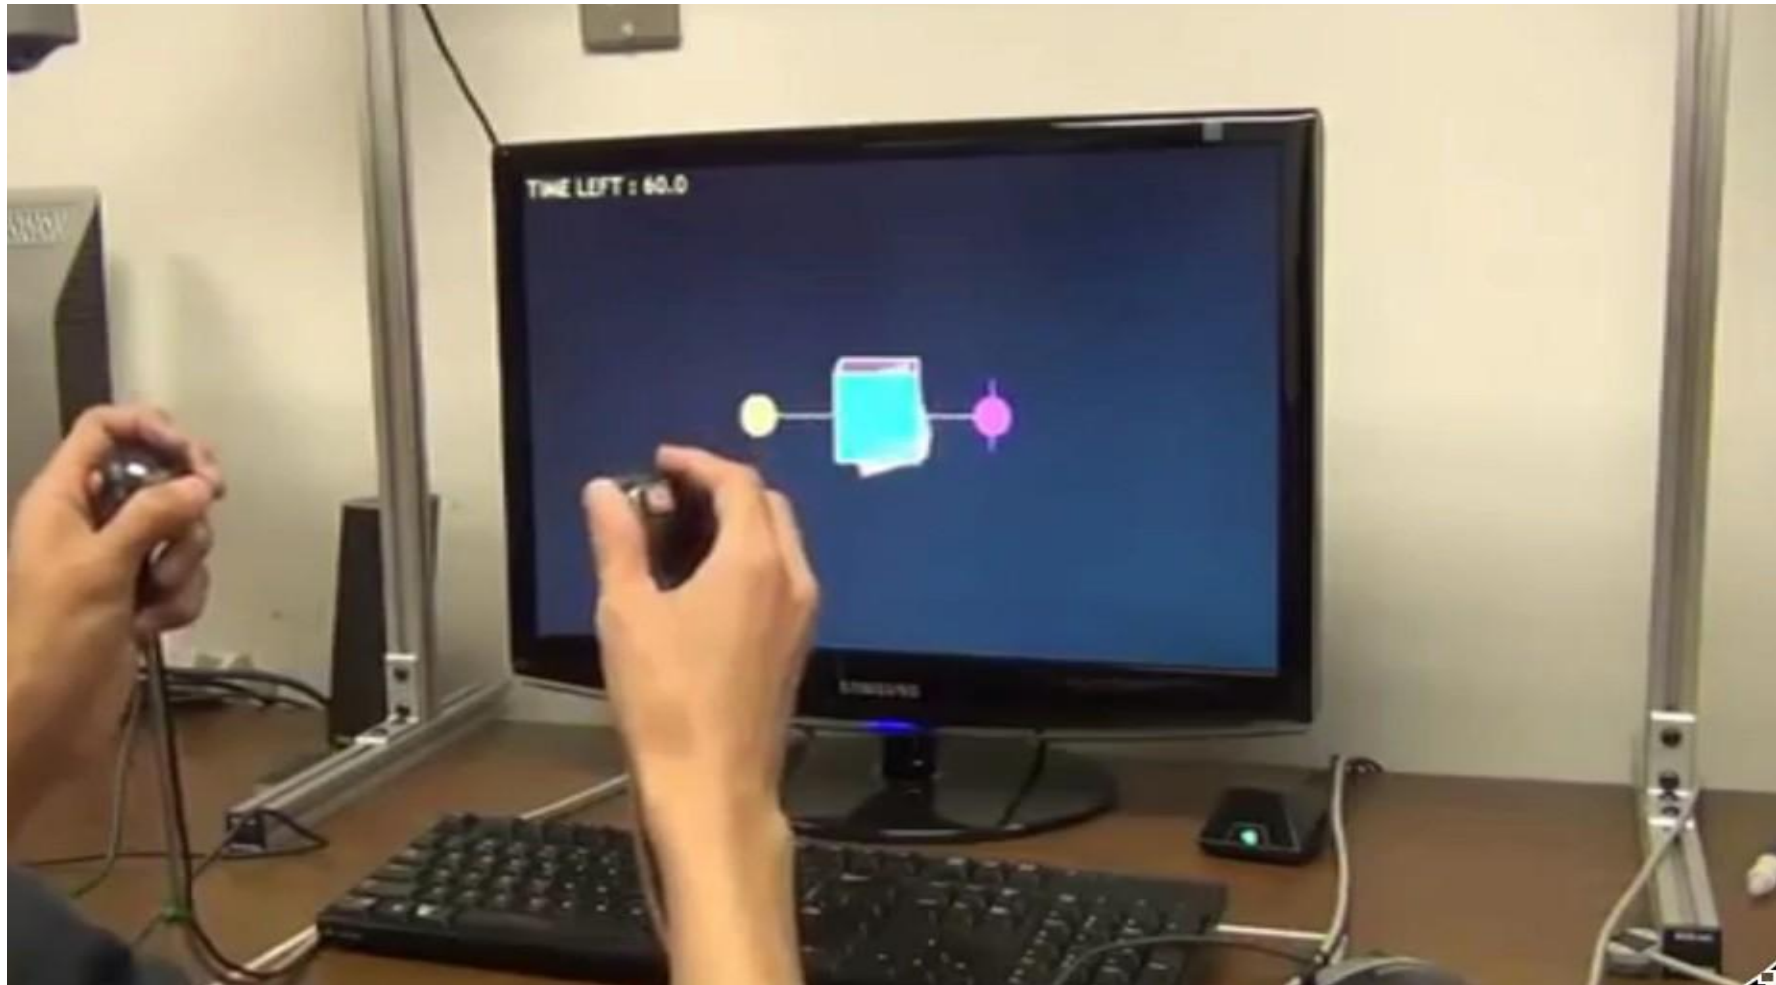

Design Guidelines for Manipulation

- There is no single best manipulation technique
- Map the interaction technique to the device
- Reduce degrees of freedom when possible
- Use techniques that can help to reduce clutching
- Consider the use of grasp-sensitive object selection
- Use pointing techniques for selection and grasping techniques for manipulation
- Use existing techniques unless there is a large amount of benefit from designing a new application-specific method
- Consider the trade-off between technique design and environmental design

NAVIGATION

Navigation
- How we move from place to place within an environment
- The combination of travel with wayfinding
    - *Wayfinding*: cognitive component of navigation
    - *Travel:* motor component of navigation
- Travel without wayfinding: "exploring", "wandering"

Travel

- The motor component of navigation
- Movement between 2 locations, setting the position (and orientation) of the user's viewpoint
- The most basic and common VE interaction technique, used in almost any large-scale VE

Types of Travel

- Exploration
  - No explicit goal for the movement
- Search
  - Moving to specific target location
    - Naïve – target position not known
    - Primed – position of target known
- Maneuvering
  - Short, precise movements changing viewpoint

Movement Process

- Focusing on user control

Travel
- Start to Move
- Indicate Position
  - Specify Position
    - discrete target specification (select object in environment, select from list, position 3D cursor, automatic selection, . . .)
    - one-time route specification (set series of markers, specify curvature and distance, . . .)
    - continuous specification (gaze-directed, pointing, physical steering props, virtual controls, 2D pointing, . . .)
  - Specify Velocity
  - Specify Acceleration
- Indicate Orientation
- Stop Moving

Technique classification

- Physical locomotion metaphors
  - treadmills, cycles, etc…
- Steering metaphor
- Route planning metaphor
- Target specification metaphor
- Manual manipulation metaphor
- Scaling metaphor

Different Locomotion Devices

Classification of Travel and Locomotion

Can classify locomotion devices in terms of real vs. virtual travel

	Virtual turning	**Real turning**
Virtual translation	Desktop VEs Vehicle simulators CAVE wand	Most HMD systems Walking in place Magic Carpet
Real translation	Stationary cycles Treadport Biport	Wide-area tracking UNIPORT ODT

Taxonomy of Travel Techniques

- Focusing on sub-task of travel
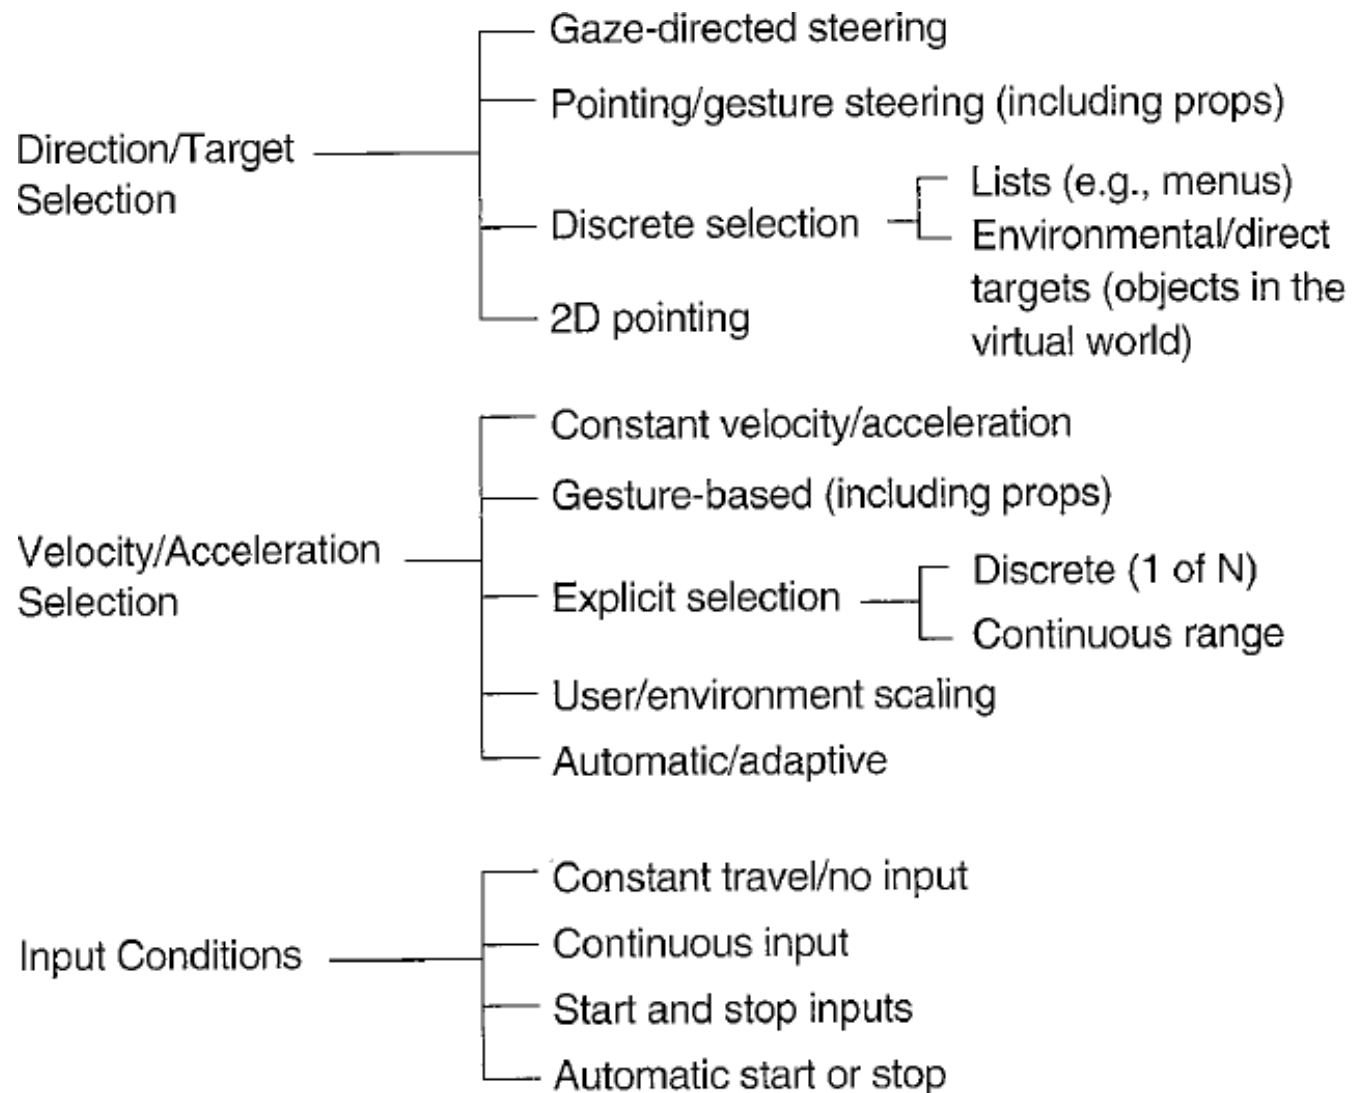

Bowman, D. A., Koller, D., & Hodges, L. F. (1997, March). Travel in immersive virtual environments: An evaluation of viewpoint motion control techniques. In *Virtual Reality Annual International Symposium, 1997., IEEE 1997* (pp. 45-52). IEEE.

Direction/Target Selection
- Gaze-directed steering
- Pointing/gesture steering (including props)
- Discrete selection
  - Lists (e.g., menus)
  - Environmental/direct targets (objects in the virtual world)
- 2D pointing

Velocity/Acceleration Selection
- Constant velocity/acceleration
- Gesture-based (including props)
- Explicit selection
  - Discrete (1 of N)
  - Continuous range
- User/environment scaling
- Automatic/adaptive

Input Conditions
- Constant travel/no input
- Continuous input
- Start and stop inputs
- Automatic start or stop

# Gaze Directed Steering

Walk when
look down

- Move in direction that you are looking
- Very intuitive, natural navigation
- Can be used on simple HMDs (e.g. Google Cardboard)
- But: Can't look in different direction while moving

Example: Gaze Directed Steering

- https://www.youtube.com/watch?v=6iKxser1Wic

TelePortation

- Use controller to select end point
  - Usable with 3DOF contoller
- Jump to a fixed point in VR
- Discrete motion can be confusing/cause sickness

https://www.youtube.com/watch?v=SbxgNnOeyF8

Pointing Technique

- A "steering" technique
- Use hand tracker instead of head tracker
  - Point in direction you want to go
- Slightly more complex, than gaze-directed steering
- Allows travel and gaze in different directions
  - good for relative motion, look one way, move another

Example: VIVE Thrust

Vive Controller: Basic Thrust Navigation / ancientc.com
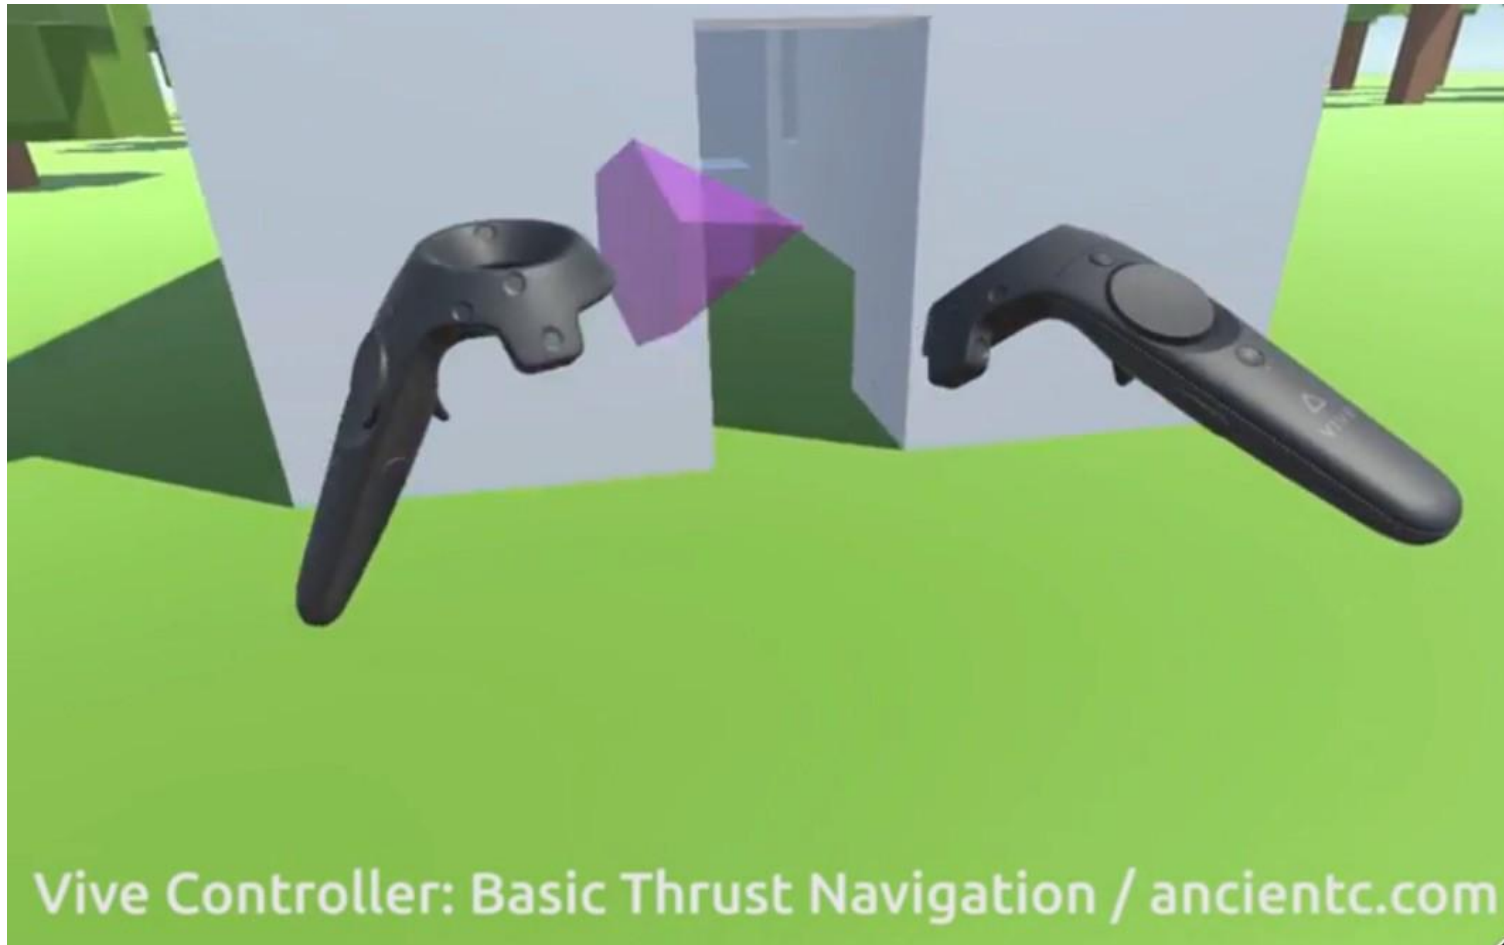

- https://www.youtube.com/watch?v=JRgCe_8q4vE

Grabbing the Air Technique

- Use hand gestures to move yourself through the world
- Metaphor of pulling a rope
- Often a two-handed technique
- May be implemented using Pinch Gloves

Mapes, D., & Moshell, J. (1995). A Two-Handed Interface for Object Manipulation in Virtual Environments. *Presence: Teleoperators and Virtual Environments, 4*(4), 403-416.
Moving Your Own Body
Moving avatar in Map View

Moving avatar in WIM view

- Can move your own body
  - In World in Miniature, or map view
- Grab avatar and move to desired point
- Immediate teleportation to new position in VE

Example: Navigation Using WIM

- https://www.youtube.com/watch?v=VxGqIjMlTs8

Walking in Place

- https://www.youtube.com/watch?v=J_yQfW1qYGI

Redirected Walking

- Address problem of limited walking space
- Warp VR graphics view of space
- Create illusion of walking straight, while walking in circles

Razzaque, S., Kohn, Z., & Whitton, M. C. (2001, September). Redirected walking. In *Proceedings of EUROGRAPHICS* (Vol. 9, pp. 105-106).
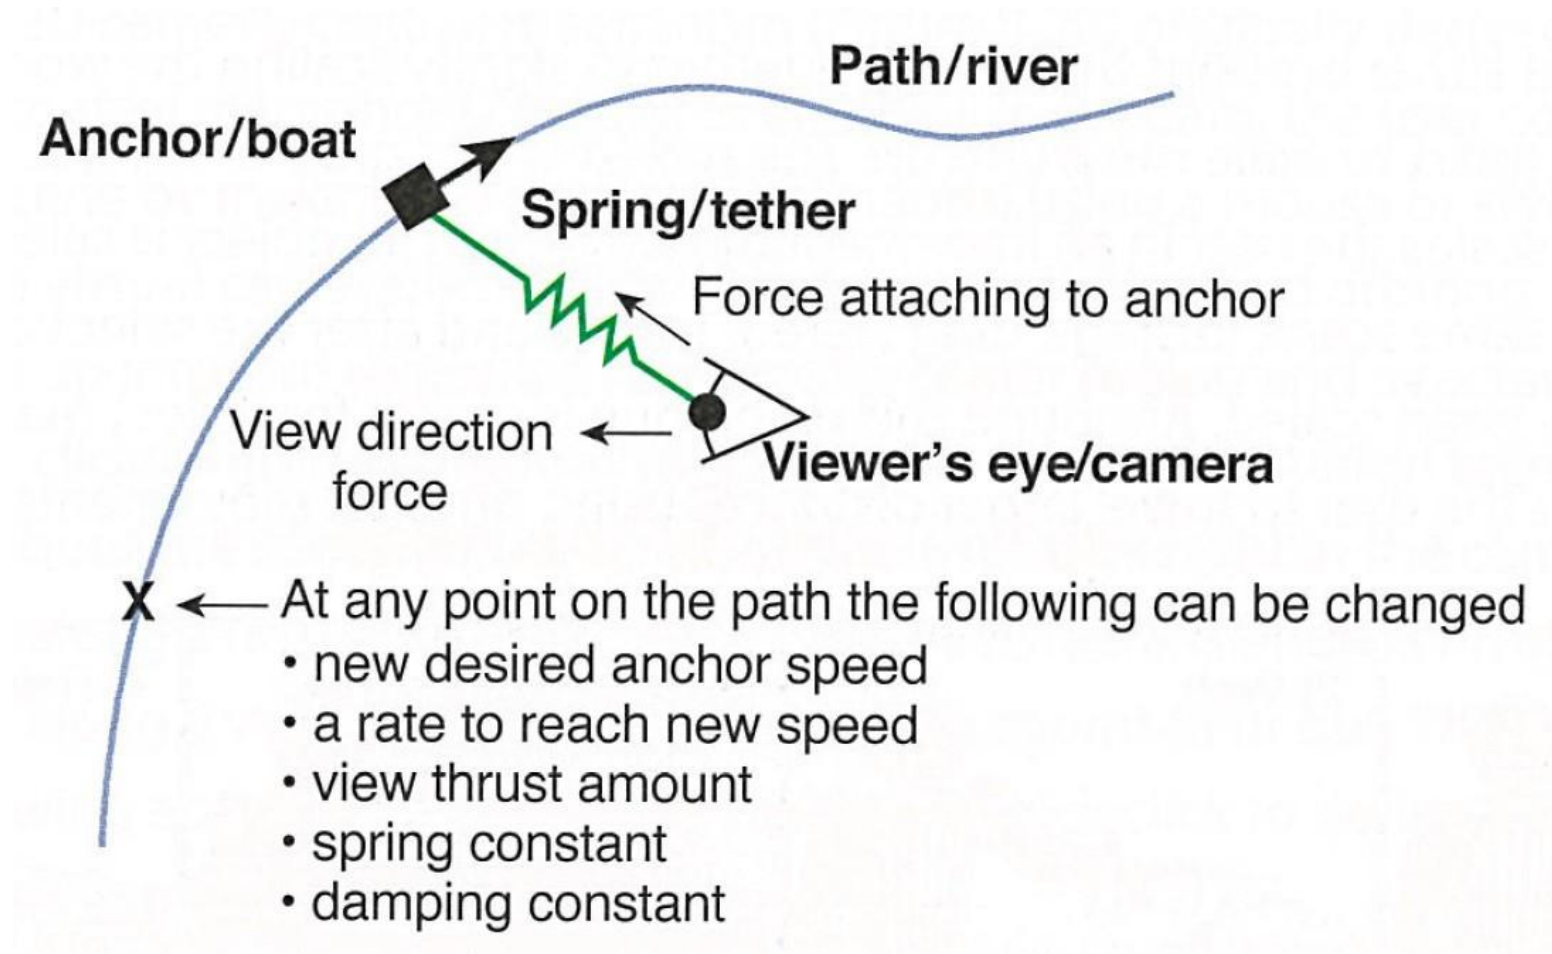

Redirected Walking

- https://www.youtube.com/watch?v=KVQBRkAq6OY
Redirected Walking with Walls

The Unlimited Corridor was designed to have users walk infinite distances in VR

- https://www.youtube.com/watch?v=u8pw81VbMUU

Guided Navigation Technique

Path/river

Anchor/boat

Spring/tether

Force attaching to anchor

View direction force

Viewer's eye/camera

X ← At any point on the path the following can be changed
- new desired anchor speed
- a rate to reach new speed
- view thrust amount
- spring constant
- damping constant

- Water skiing metaphor for VR movement
- Good for moving in a fixed direction, while giving user some control

Example

Virtual Jungle Cruise
DisneyQuest

©Koma 2004

Wayfinding

- The means of
  - determining (and maintaining) awareness of where one is located (in space and time),
  - and ascertaining a path through the environment to the desired destination

- Problem: 6DOF makes wayfinding hard
  - human beings have different abilities to orient themselves in an environment, extra freedom can disorient people easily

- Purposes of wayfinding tasks in virtual environments
  - Transferring spatial knowledge to the real world
 - Navigation through complex environments in support of other tasks

Wayfinding – Making Cognitive Maps

- Goal of Wayfinding is to build Mental Model (Cognitive Map)
- Types of spatial knowledge in a mental model
  - landmark knowledge
  - procedural knowledge (sequence of actions required to follow a path)
  - map-like (topological) knowledge

- Creating a mental model
  - systematic study of a map
  - exploration of the real space
  - exploration of a copy of the real space

- Problem: Sometimes perceptual judgments are incorrect within a virtual environment
  - e.g. users wearing a HMD often underestimate dimensions of space, possibly caused by limited field of view

# Wayfinding as a Decision Making Process
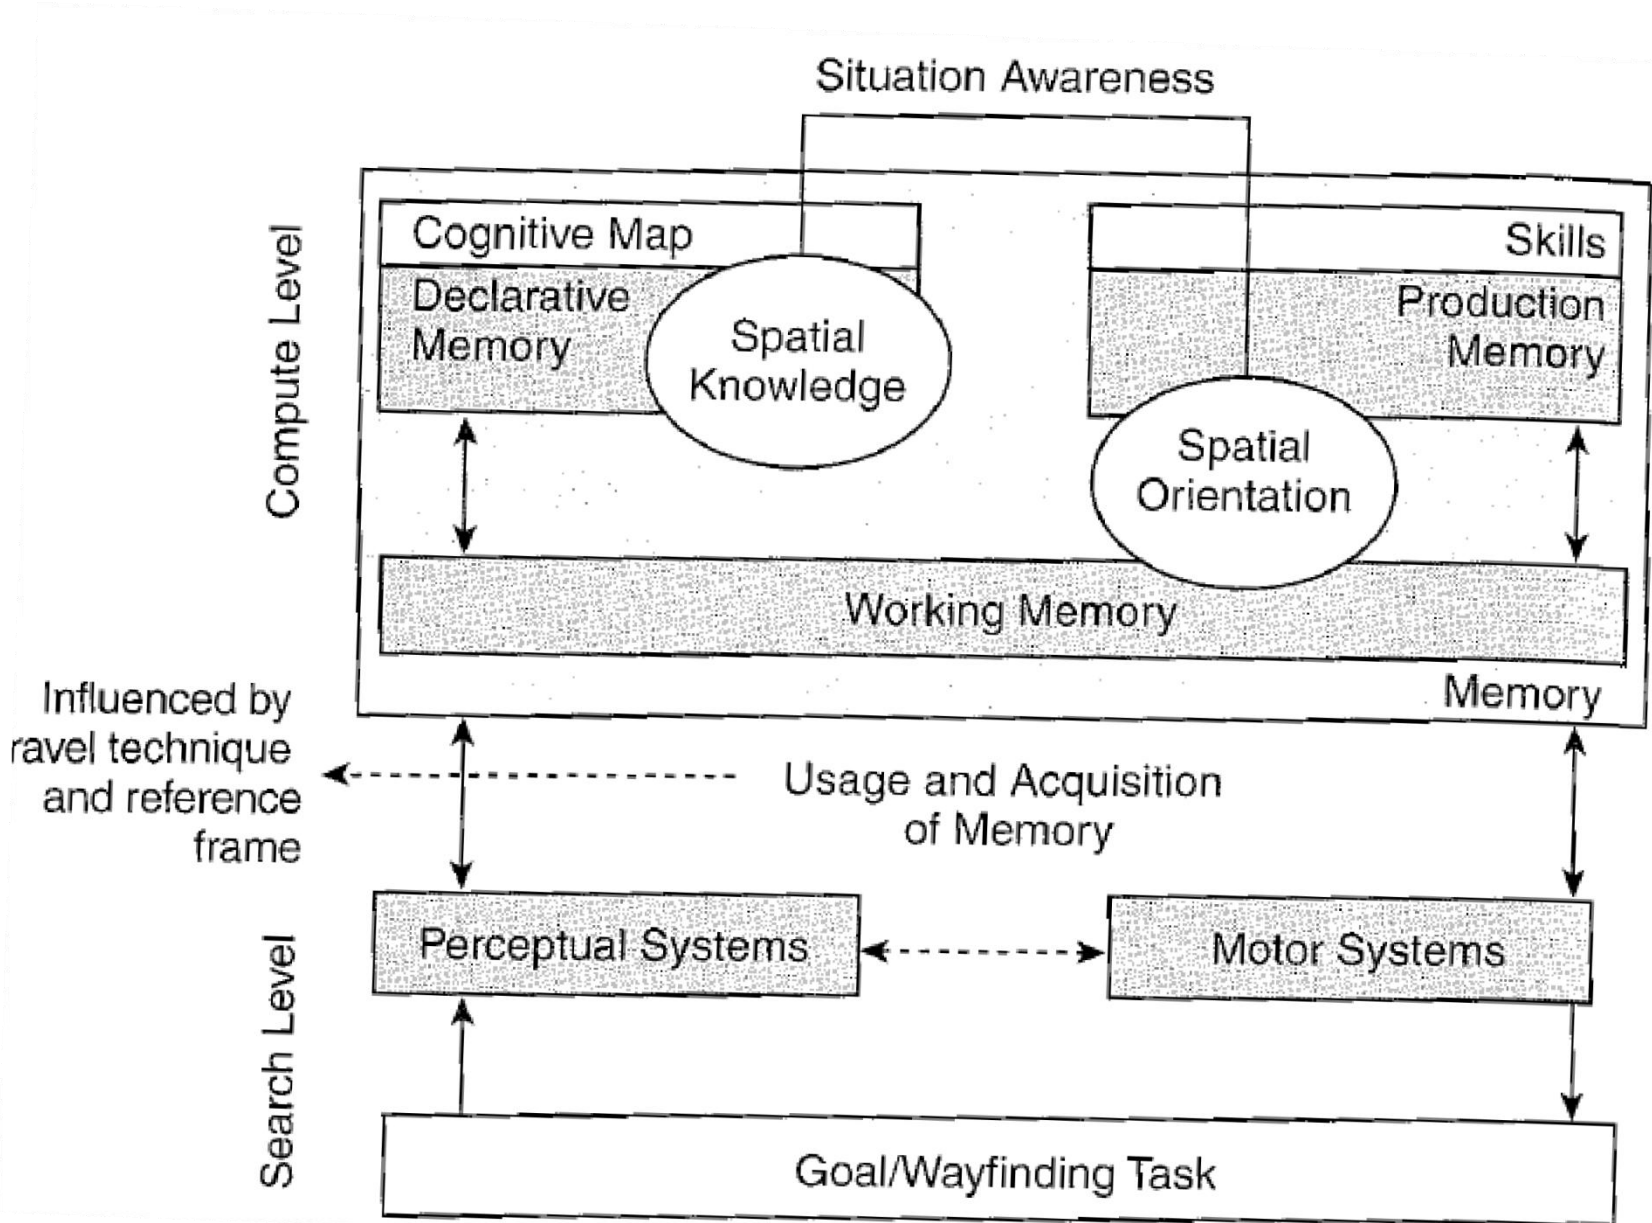

Kevin Lynch – The Image of the City
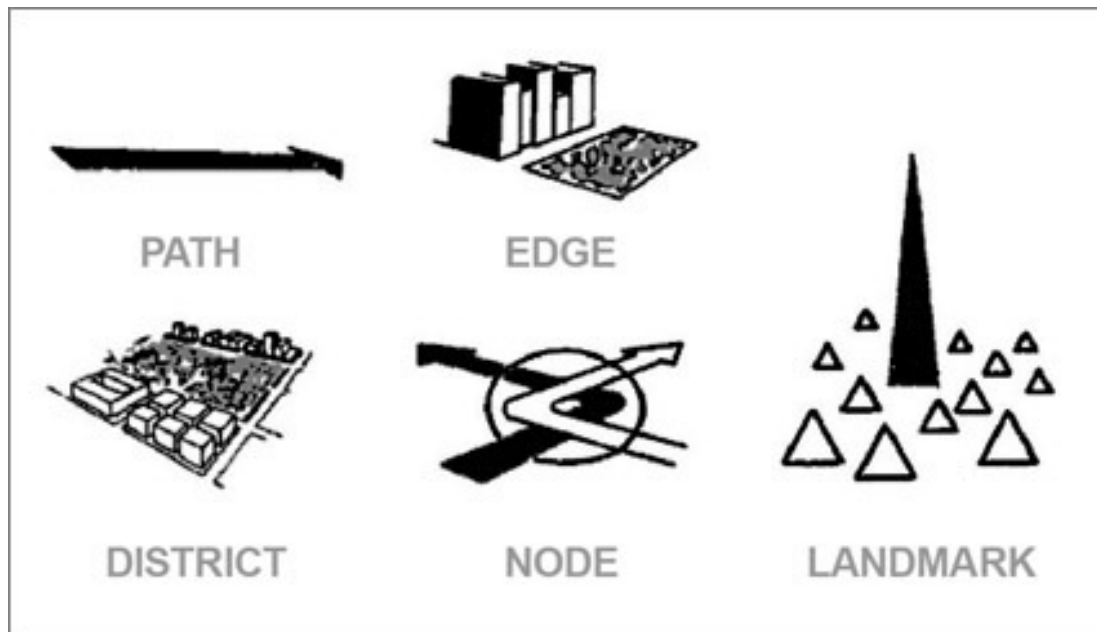

- In real cities, five elements
  - Path, Edge, District, Node, Landmark
- VR environments the same

FIG. 14. *The visual form of Los Angeles as seen in the field*
Designing VE to Support Wayfinding

- Provide Landmarks
  - Any obvious, distinct and non-mobile object can serve as a landmark
  - A good landmark can be seen from several locations (e.g. tall)
  - Audio beacons can also serve as landmarks

- Use Maps
  - Copy real world maps
  - Ego-centric vs. Exocentric map cues
  - World in Miniature
  - Map based navigation

Wayfinding Aids

- ## Path following
  - Easy method of wayfinding
  - Multiple paths through a single space may be denoted by colors
    - For example, hospitals that use colored lines to indicate how to get to certain locations.

- ## Bread crumbs (leaving a trail)
  - leaving a trail of markers - like Hänsel and Gretel
  - allows participant to know when they've been somewhere before
  - having too many markers can make the space be overly cluttered

- ## Compass
  - may also be other form of direction indicator (e.g. artificial horizon)
  - may specify directions in 2D space or 3D space

# Examples

Design Guidelines for Navigation

- Match the travel technique to the application
- Use an appropriate combination of travel technique, display devices, and input devices
- The most common travel tasks should require a minimum of effort from the user
- Use physical locomotion technique if user exertion or naturalism is required
- Use target-based techniques for goal-oriented travel and steering techniques for exploration and search
- Provide multiple travel techniques to support different travel tasks in the same application
- Choose travel techniques that can be easily integrated with other interaction techniques in the application
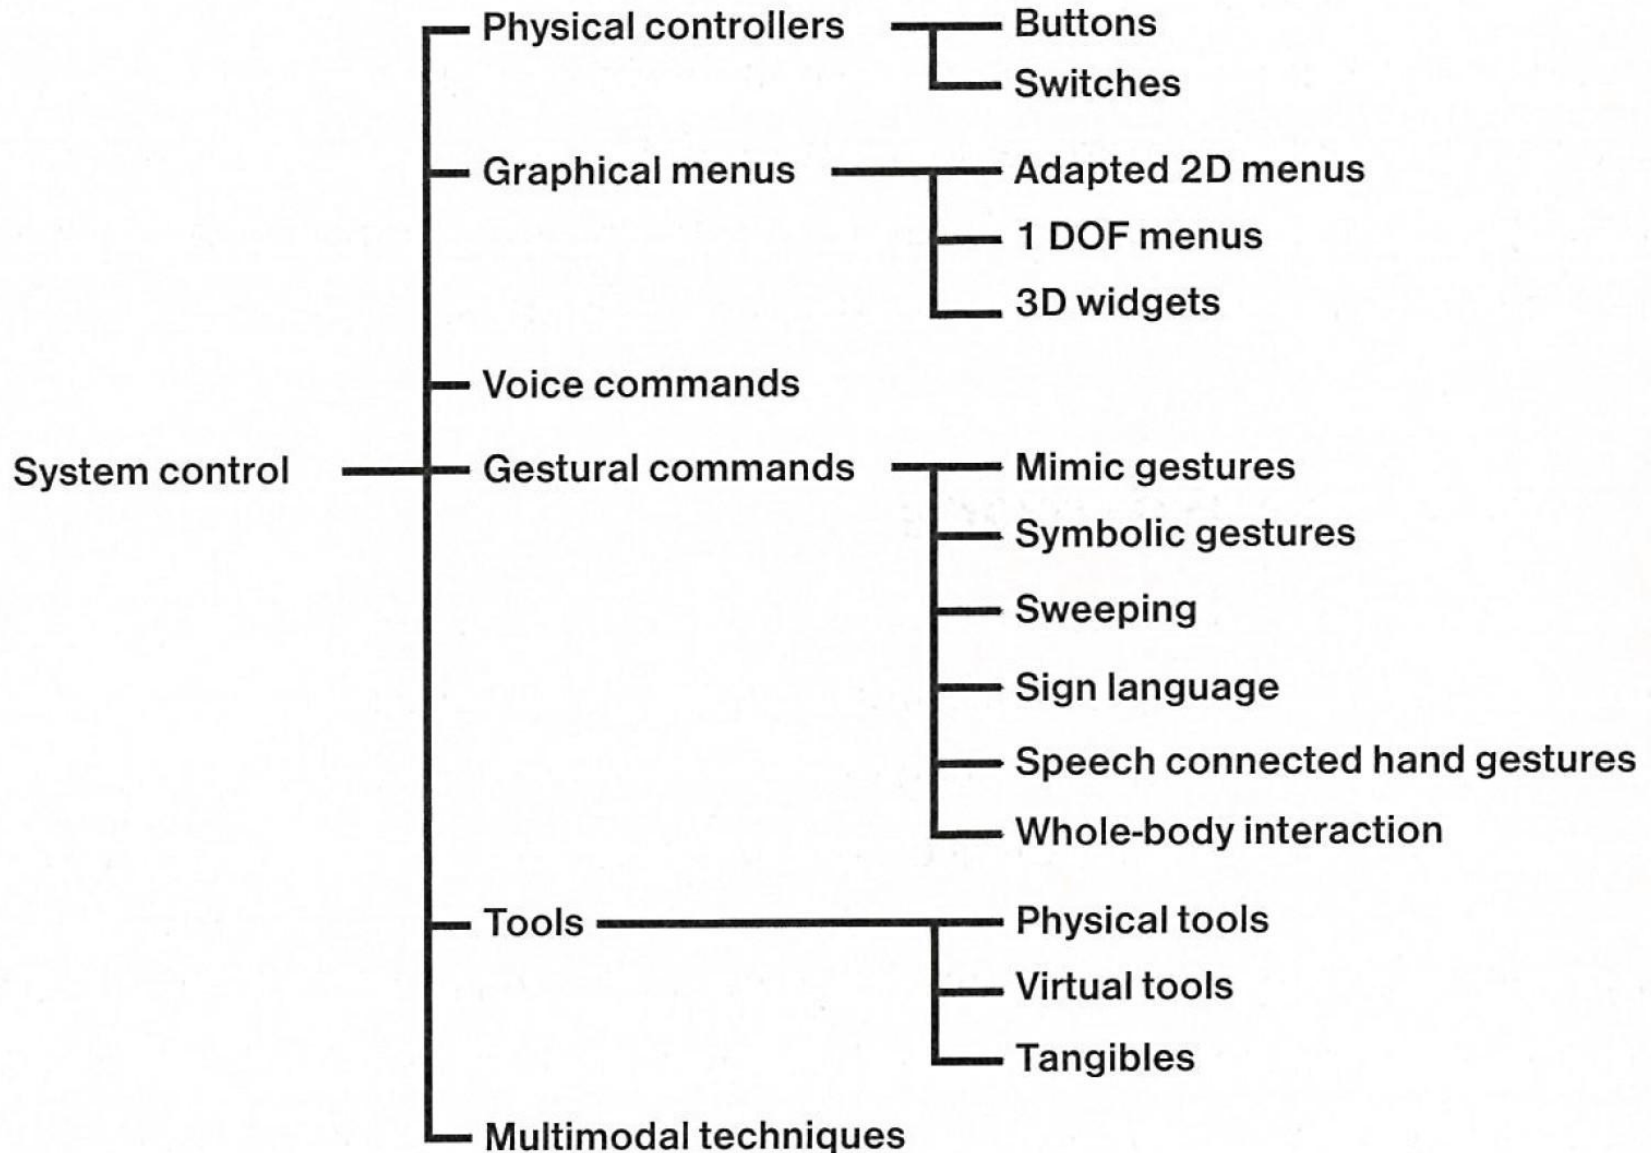

SYSTEM CONTROL

System Control

- Issuing a command to change system state or mode

- Examples
  - Launching application
  - Changing system settings
  - Opening a file
  - Etc.

- Key points
  - Make commands visible to user
  - Support easy selection

System Control Options

System control
- Physical controllers
  - Buttons
  - Switches
- Graphical menus
  - Adapted 2D menus
  - 1 DOF menus
  - 3D widgets
- Voice commands
- Gestural commands
  - Mimic gestures
  - Symbolic gestures
  - Sweeping
  - Sign language
  - Speech connected hand gestures
  - Whole-body interaction
- Tools
  - Physical tools
  - Virtual tools
  - Tangibles
- Multimodal techniques

Example: GearVR Interface

- 2D Interface in 3D Environment
- Head pointing and click to select

https://www.youtube.com/watch?v=qMadjF1B3rI

TULIP Menu
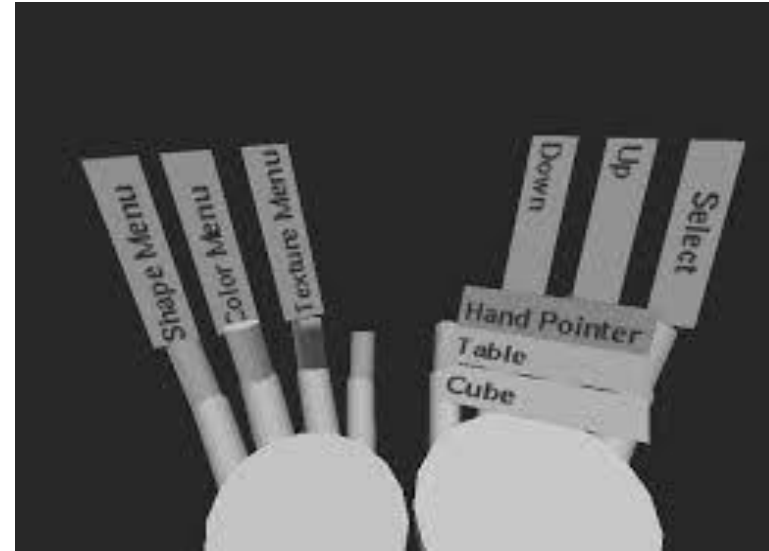

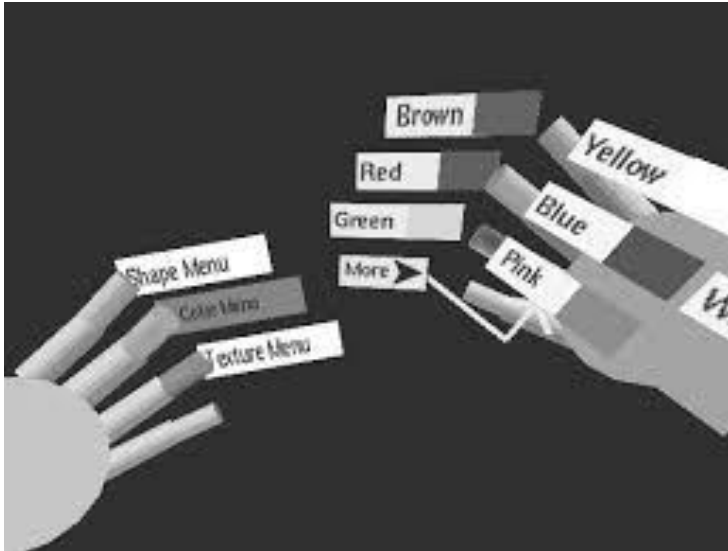

- Menu items attached to virtual finger tips
- Ideal for pinch glove interaction
- Use one finger to select menu option from another

Bowman, D. A., & Wingrave, C. A. (2001, March). Design and evaluation of menu systems for immersive virtual environments. In *Virtual Reality, 2001. Proceedings. IEEE* (pp. 149-156). IEEE.
2D Menus in VR

2D Menu in VR CAVE

Nested Pie Menu

- Many examples of 2D GUI and floating menus in VR

Example: Marking Menu in VR

- https://www.youtube.com/watch?v=BTTBgZ94IAc

Tools

- Use tools for system commands
  - Tangible user interfaces (real tools)
  - Virtual tools (3D objects)

- Design issues
  - Support eyes-off use
  - Use of physical affordances
  - Base on familiar objects
  - Provide tactile feedback
  - Map real tool to virtual operation
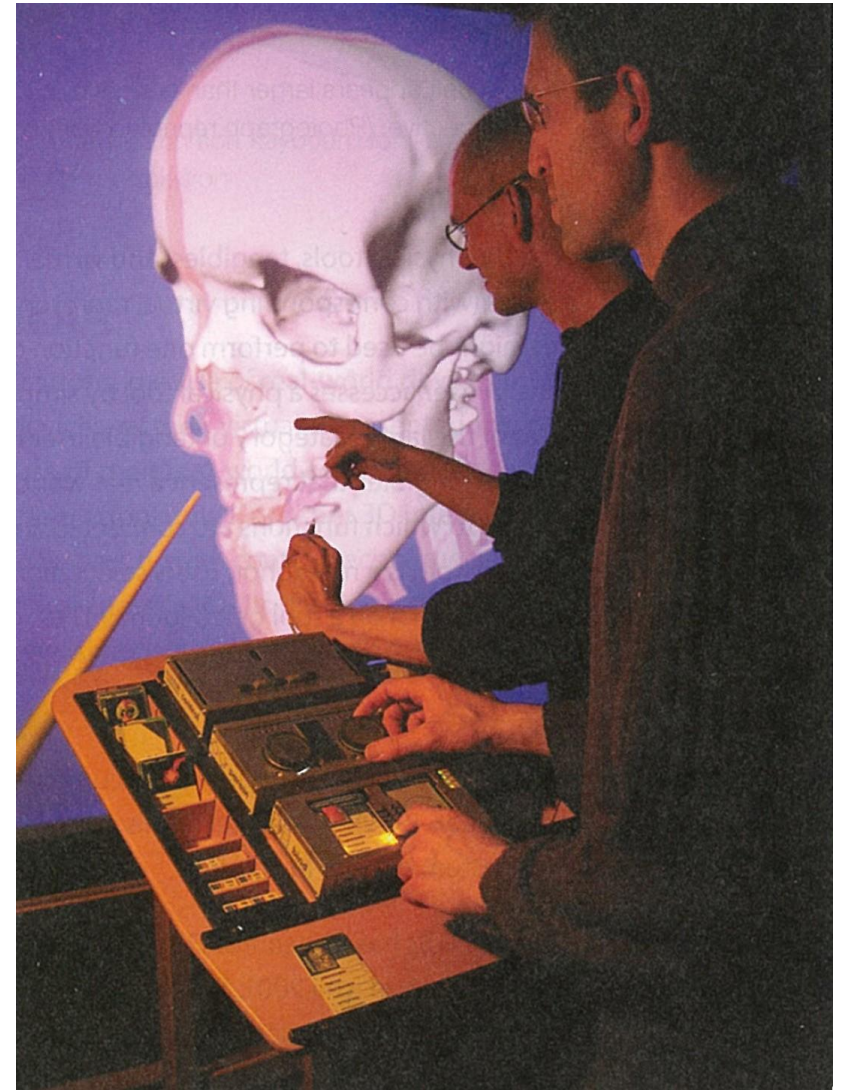

Tangible interface for CAVE

Voice Input

- ## Implementation
  - Wide range of speech recognition engines available
 - E.g. Unity speech recognition plug-in, IBM VR speech sandbox
- ## Factors to consider
  - Recognition rate, background noise, speaker dependent/independent
- ## Design Issues
  - Voice interface invisible to user
    - no UI affordances, overview of functions available
  - Need to disambiguate system commands from user conversation
    - Use push to talk or keywords
  - Limited commands – use speech recognition
  - Complex application – use conversational/dialogue system

Example – IBM VR Speech Sandbox

ibm.biz/vr-speech-sandbox

- https://www.youtube.com/watch?v=NoO2R3Pz5Go
- Available from: http://ibm.biz/vr-speech-sandbox

Design Guidelines for System Control

- Avoid mode errors

- Design for discoverability

- Consider using multimodal input

- Use an appropriate spatial reference frame

- Prevent unnecessary focus and context switching

- Avoid disturbing the flow of action of an interaction task

- Structure the functions in an application and guide the user

- 3D is not always the best solution – consider hybrid interfaces

CONCLUSION

Conclusions

- Usability one of the most crucial issues facing VE applications

- Implementation details critical to ensure usability

- Ease of coding not equal to ease of use

- Simply adapting 2D interfaces is not sufficient

Conclusions

- User interface key for good VR experience
  - Need 3D user interface techniques

- Design for
  - Selection/Manipulation
  - Navigation
  - System control

- Follow good design guidelines
  - Cannot just implement 2D techniques in VR
