

## DOUBLY REINFORCED SECTION

Q1. Design a RCB of rectangular section using the following data. Effective span = 5m, width of beam = 250mm, overall depth = 500mm, working load = 40 KN/m, effective cover = 50mm. M20 grade concrete & Fe 415 grade steel is used.

Given Data:

$$L = 5\text{m}, \quad b = 250\text{mm}, \quad D = 500\text{mm}, \quad d' = 50\text{mm}, \quad d = D - d' = 500 - 50 = 450\text{mm}$$

$$f_{ck} = 20\text{N/mm}^2 \quad f_y = 415\text{N/mm}^2$$

$$W = 40\text{KN/m}$$

Solution:

*Step 1:-* Cross-section dimension

$$b = 250\text{mm}, \quad D = 500\text{mm}, \quad d' = 50\text{mm}, \quad d = 450\text{mm}, \quad L = 5000\text{mm}$$

*Step 2:-* Load Calculation

$$\text{Working load, } W = 40\text{KN/m}$$

$$\begin{aligned} \text{Ultimate Load} &= \text{Total load} * \text{partial safety factor} \\ &= 40 * 1.5 = 60\text{KN/m} \end{aligned}$$

$$W_u = 60\text{KN/m}$$

*Step 3:-* Shear force & bending moment

$$\begin{aligned} M_u &= \frac{W_u l^2}{8} \quad [\text{Ultimate moment}] \\ &= 60 * 5^2 / 8 = 187.5\text{KN.m} \end{aligned}$$

$$\begin{aligned} V_u &= \frac{W_u l}{2} \quad [\text{Shear forces}] \\ &= 60 * 5 / 2 = 150\text{KN} \end{aligned}$$

*Step 5:-* Check for  $M_u$ ,  $M_{u, \text{lim}}$

$$\begin{aligned} M_{u, \text{lim}} &= 0.138 * f_{ck} * b * d^2 \\ &= 0.138 * 20 * 250 * 450^2 = 139.73\text{KNm say } 140\text{KN.m} \end{aligned}$$

$M_u > M_{u, \text{lim}} \Rightarrow$  Over reinforced section (i.e.) it is doubly reinforced section

$$\begin{aligned} M_u - M_{u, \text{lim}} &= 187.5 - 140 \quad [\text{Pg No. 96}] \\ &= 47.5\text{KN.m} \end{aligned}$$

$$f_{sc} = 0.0035 \left\{ \frac{[X_{umax} - d]}{X_{umax}} \right\} * E_s$$

$$X_{umax}/d = 0.48 \Rightarrow X_{umax} = 0.48 * d = 0.48 * 450$$

$$f_{sc} = 0.0035 \left\{ \frac{[(0.48 * 450) - 50]}{0.48 * 450} \right\} * 2 * 10^5$$

$$= 538 \text{ N/mm}^2$$

Check:  $f_{sc} > 0.87 f_y$

$$538 > 361 \text{ (so adopt } f_{sc} \text{ as } 361 \text{ N/mm}^2)$$

$$M_u, M_{ulim} = f_{sc} \cdot A_{sc} (d - d') \text{ [Pg No - 96]}$$

$$187 * 10^6 - 140 * 10^6 = 361 * A_{sc} (450 - 50)$$

$$A_{sc} = 328 \text{ mm}^2$$

i. Use 16mm  $\phi$

$$n = A_{st}/a_{st} = 328 / (\pi * 16^2 / 4) = 1.63 \approx 2 \text{ nos}$$

therefore provide 2 nos of 16mm  $\phi$

$$A_{st2} = \frac{A_{sc} \cdot f_{sc}}{0.87 \cdot f_y} \quad \text{[Pg No- 96]}$$

$$= 328 * 361 / (0.87 * 415)$$

$$= 328 \text{ mm}^2$$

$$A_{st1} = \left[ \frac{0.36 \cdot f_{ck} \cdot b \cdot X_{umax}}{0.87 f_y} \right]$$

$$\{ \text{from } X_{umax}/d = [0.87 f_y \cdot A_{st} / (0.36 \cdot f_{ck} \cdot b \cdot d)] \}$$

$$= 0.36 * 20 * 250 * (0.48 * 450) / 0.87 * 415$$

$$= 1077 \text{ mm}^2$$

$$A_{st} = A_{st1} + A_{st2}$$

$$= 1077 + 328 = 1405 \text{ mm}^2$$

ii. Use 25mm  $\phi$

$$n = A_{st}/a_{st} = 1405 / (\pi * 25^2 / 4) = 3 \text{ nos}$$

therefore provide 3 nos of 25mm  $\phi$

Step 5:- Check for shear stress

$$\tau_v = V_u / bd = (150 * 10^3) / (250 * 450) \text{ [Pg No 72]}$$

$$= 1.33 \text{ N/mm}^2$$

$$\text{Percentage of tension reinforced, } p_t = 100 A_{st} / bd = 100 * 1405 / 250 * 450 = 1.25$$

$$\tau_c = 0.67 \text{ [refer table 19 Pg N0. 73]}$$

$\tau_v > \tau_c \Rightarrow$  therefore shear reinforcement shall be provided.

$$V_{us} = V_u - \tau_c bd \text{ [Pg No - 73]}$$

$$V_{us} = 74625 \text{ N}$$

Use 8mm  $\phi$  2 legged stirrups

$$A_{sv} = \left[ \frac{\pi d^2}{4} \right] * 2 = \left[ \frac{\pi * 8^2}{4} \right] * 2 = 100.53 \text{ mm}^2$$

$$V_{us} = \frac{A_{sv} (0.87 f_y) d}{s_v}$$

$$\text{Therefore } s_v = \frac{A_{sv} (0.87 f_y) d}{V_{us}}$$
$$= 100.53(0.87 * 415)450 / 74625$$

$$s_v = 218.87 \text{ mm, say } 200 \text{ mm}$$

Provide 2 legged 8mm  $\phi$  stirrups @ 200mm c/c.

Step 6:- Check for deflection

$$(L/d)_{\max} = (L/d)_{\text{basic}} \cdot K_t \cdot K_c \cdot K_f \quad [\text{pg No. 37, clause 23.2.1}]$$

$$= 20 * K_t \cdot K_c \cdot K_f$$

[Pg No 38, below fig 4]

$$* f_s = 0.58 f_y \left[ \frac{\text{Area of crosssection of steel required}}{\text{Area of crosssection of steel provided}} \right]$$

$$= 0.58 \cdot f_y [1405/1472.62]$$

$$A_{st}(\text{provided}) = 3 * \pi * 25^2 / 4 = 1472.62 \text{ mm}^2$$

$$= 230 \text{ N/mm}^2$$

$$K_t = 0.9 \quad [\text{from graph}]$$

$$\% \text{ of tension} = 1.25$$

$$f_s = 230 \text{ N/mm}^2$$

$$\% \text{ of compression reinforcement} = 100 A_{st} / b d \Rightarrow 100 * 328 / 250 * 450 = 0.29$$

$$K_c = 1 \quad [\text{for doubly RCB}]$$

$$\Rightarrow (L/d)_{\max} = 20 * 0.9 * 1.09 * 1 = 19.62$$

$$\Rightarrow (L/d)_{\text{actual}} = 5000 / 450 = 11.1$$

$$(L/d)_{\max} > (L/d)_{\text{actual}}$$

Therefore deflection is in control
