

UNIT 2

Spectroscopic techniques using UV/Vis, NIR, NMR, atomic absorption

UV/Vis Spectroscopy (Ultraviolet-Visible Spectroscopy)

- **Principle:** UV/Vis spectroscopy measures the absorbance of ultraviolet or visible light by a sample at different wavelengths. The absorbance is related to the concentration of specific compounds in the sample.
- **Applications in Food:**
 - **Quantification of Pigments:** UV/Vis is used to measure the concentration of natural and synthetic pigments, such as carotenoids, anthocyanins, and chlorophyll, in food products.
 - **Determination of Antioxidants:** It helps in analyzing the content of antioxidants like ascorbic acid and phenolic compounds in fruits, vegetables, and beverages.
 - **Protein and Nucleic Acid Analysis:** This technique is used to quantify proteins and nucleic acids, especially in dairy and meat products.
 - **Quality Control:** UV/Vis is widely used for routine quality control of food additives, vitamins, and preservatives.

Ultraviolet-Visible Spectroscopy

2. NIR Spectroscopy (Near-Infrared Spectroscopy)

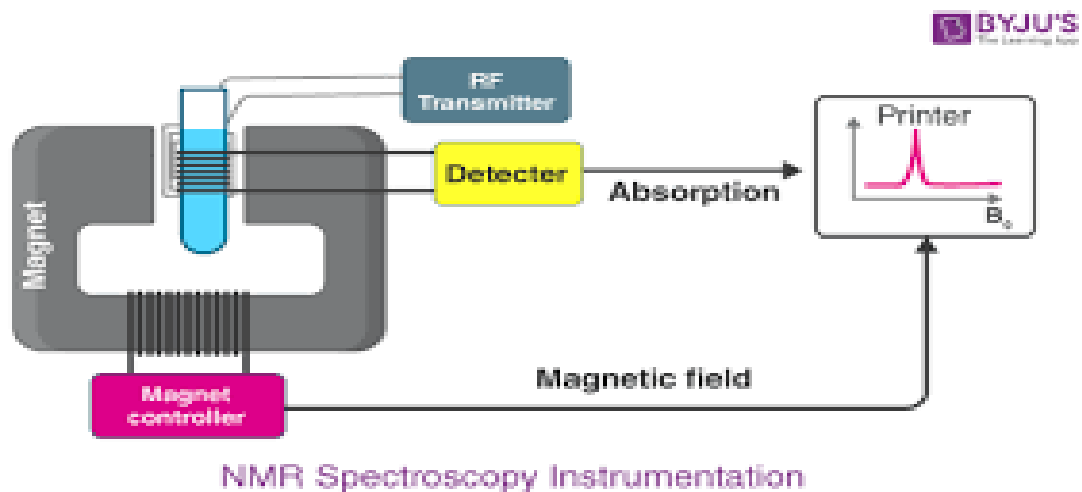

- **Principle:** NIR spectroscopy measures the absorption of near-infrared light by a sample, which provides information about the molecular vibrations of chemical bonds, particularly those involving C-H, N-H, and O-H groups.
- **Applications in Food:**
 - **Moisture Content:** NIR is commonly used to determine the moisture content in cereals, grains, and other food products.
 - **Fat and Protein Analysis:** It is used to measure fat, protein, and carbohydrate content in dairy, meat, and bakery products.
 - **Nutrient Profiling:** NIR can quickly assess the nutrient composition of various food products, making it useful for nutritional labeling.
 - **Process Control:** NIR is employed in the monitoring and control of food processing, such as drying, fermentation, and mixing processes.

3. NMR Spectroscopy (Nuclear Magnetic Resonance Spectroscopy)

- **Principle:** NMR spectroscopy relies on the magnetic properties of certain atomic nuclei. When placed in a magnetic field, these nuclei absorb and re-emit electromagnetic radiation at specific frequencies, providing detailed information about the molecular structure and dynamics.
- **Applications in Food:**
 - **Fatty Acid Profiling:** NMR is used to analyze the fatty acid composition in oils, dairy, and meat products.
 - **Authentication and Adulteration Detection:** It can detect adulteration in foods by identifying unusual components or verifying geographic origin (e.g., in wine and olive oil).
 - **Metabolomics:** NMR is employed in food metabolomics to study the chemical fingerprints left by specific metabolic processes in food.
 - **Quality Control:** NMR can monitor changes in food products over time, such as ripening in fruits and spoilage in perishable goods.

4. Atomic Absorption Spectroscopy (AAS)

- **Principle:** AAS measures the absorption of light by free atoms in the gaseous state. It is highly specific for detecting and quantifying trace elements and metals in samples.

UNIT 2

Spectroscopic techniques using UV/Vis, NIR, NMR, atomic absorption

- **Applications in Food:**
 - **Metal Contamination:** AAS is widely used to detect and quantify trace metals (e.g., lead, cadmium, arsenic, and mercury) in food products, ensuring compliance with safety regulations.
 - **Mineral Content Analysis:** It is used to determine essential minerals like calcium, iron, zinc, and magnesium in various foods.
 - **Nutritional Labeling:** AAS helps in the accurate labeling of micronutrient content, particularly in fortified foods and dietary supplements.
 - **Food Safety:** It plays a crucial role in monitoring and controlling food safety by detecting toxic metal residues that may result from environmental contamination or food processing.
