

SNS COLLEGE OF TECHNOLOGY

Coimbatore-35.
An Autonomous Institution

COURSE NAME: 23CST101-PROBLEM SOLVING & C PROGRAMMING

I YEAR/ I SEMESTER

UNIT-II C PROGRAMMING BASICS

Topic: C Tokens

Department of Computer Science and Engineering

C Tokens

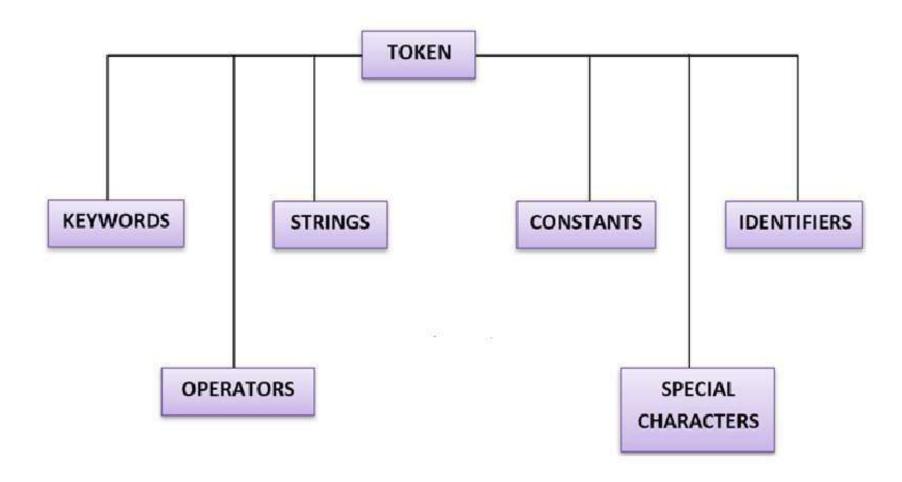

- In C programs, each word and punctuation is referred to as a token.
- C Tokens are the smallest building block or smallest unit of a C program.
- The compiler breaks a program into the smallest possible units and proceeds to the various stages of the compilation, which is called token.
- C Supports Six Types of Tokens:
 - 1. Identifiers
 - 2. Keywords
 - 3. Constants
 - 4. Strings
 - 5. Operators
 - 6. Special Symbols

C Tokens

Character Set

• A character set is a set of alphabets, letters and some special characters that are valid in C language.

Alphabets

C accepts both lowercase and uppercase alphabets as variables and functions.

Digits

```
0 1 2 3 4 5 6 7 8 9
```

Character Set

Special Characters

Special Characters in C Programming					
,	<	>		-	
()	;	\$:	
%	[]	#	?	
1	&	{	}	п	
^	!	*	/	I	
-	\	er .	+		

White Space Characters

• Blank space, newline, horizontal tab, carriage return and form feed.

C Keywords

- In 'C' every word can be either a keyword or an identifier.
- A keyword is a reserved word.
- Keywords have fixed meanings, and the meaning cannot be changed.
- You cannot use it as a variable name, constant name, etc.
- They act as a building block of a 'C' program.
- There are a total of 32 keywords (reserved words) in 'C'.
- Keywords are written in lowercase letters.

C Keywords

For example:

```
Here, int is a keyword that indicates money is a variable of type int (integer).
```

Here is a list of all keywords allowed in ANSI C.

auto	double	int	struct
break	else	long	switch
case	enum	register	typedef
char	extern	return	union
const	short	float	unsigned
continue	for	signed	void
continue default	for goto	signed sizeof	void volatile

C Identifiers

- An identifier is nothing but a name assigned to an element in a program.
- Example, name of a variable, function, etc.
- Identifiers are the user-defined names consisting of 'C' standard character set.
- As the name says, identifiers are used to identify a particular element in a program.
- Each identifier must have a unique name.
- For Example:

```
int money;
double accountBalance;
Here, money and accountBalance are identifiers.
```

Rules for constructing C identifiers: Cldentifiers

- An identifier can only have alphanumeric characters (a-z , A-Z , 0-9) (i.e. letters & digits) and underscore(_) symbol.
- The first character of an identifier should be either an alphabet or an underscore, and then it can be followed by any of the character, digit, or underscore.
- It should not begin with any numerical digit.
- In identifiers, both uppercase and lowercase letters are distinct. Therefore, we can say that identifiers are case sensitive.
- Commas or blank spaces cannot be specified within an identifier.
- Keywords cannot be represented as an identifier.
- The length of the identifiers should not be more than 31 characters.
- Identifiers should be written in such a way that it is meaningful, short, and easy to read.

C Identifiers

Example of valid identifiers

total, sum, average, _m _, sum_1, etc.

Example of invalid identifiers

2sum (starts with a numerical digit)
int (reserved word)
char (reserved word)
m+n (special character, i.e., '+')

Differences between Keyword and Identifier

Keyword	Identifier
Keyword is a pre-defined word.	The identifier is a user-defined word
It must be written in a lowercase letter.	It can be written in both lowercase and uppercase letters.
Its meaning is pre-defined in the c compiler.	Its meaning is not defined in the c compiler.
It is a combination of alphabetical characters.	It is a combination of alphanumeric characters.
It does not contain the underscore character.	It can contain the underscore character.

- Variables are memory locations(storage area) in the C programming language.
- The primary purpose of variables is to store data in memory for later use.
- Unlike constants which do not change during the program execution, variables value may change during execution.
- If you declare a variable in C, that means you are asking the operating system to reserve a piece of memory with that variable name.

Variable Declaration:

Syntax

```
type variable_name;
```

or

type variable_name, variable_name;

Variable Declaration and Initialization:

Example

```
int width, height=5;
char letter='A';
float age, area;
double d;

/* actual initialization */width = 10;
age = 26.5;
```

Variable Assignment:

- · A variable assignment is a process of assigning a value to a variable.
- Example

```
int width = 60;
int age = 31;
```

SIS WESTITUTIONS

Rules for defining variables:

- A variable name can consist of Capital letters A-Z, lowercase letters a-z, digits 0-9, and the underscore character.
- The first character must be a letter or underscore.
- Blank spaces cannot be used in variable names.
- Special characters like #, \$ are not allowed.
- · C keywords cannot be used as variable names.
- · Variable names are case sensitive.
- · Values of the variables can be numeric or alphabetic.
- · Variable type can be char, int, float, double, or void.

Types of Variables in C:

- There are many types of variables in c:
 - 1. Local Variable
 - 2. Global Variable
 - 3. Static Variable
 - 4. Automatic Variable
 - 5. External Variable

Local Variable

A variable that is declared inside the function or block is called a local variable.

It must be declared at the start of the block.

```
void function1(){
int x=10;//local variable
}
```

You must have to initialize the local variable before it is used.

Global Variable

A variable that is declared outside the function or block is called a global variable. Any function can change the value of the global variable. It is available to all the functions.

It must be declared at the start of the block.

```
int value=20;//global variable
void function1(){
int x=10;//local variable
}
```

Static Variable

A variable that is declared with the static keyword is called static variable.

It retains its value between multiple function calls.

```
void function1(){
int x=10;//local variable
static int y=10;//static variable
x=x+1;
y=y+1;
printf("%d,%d",x,y);
}
```

If you call this function many times, the local variable will print the same value for each function call, e.g, 11,11,11 and so on. But the static variable will print the incremented value in each function call, e.g. 11, 12, 13 and so on.

Automatic Variable

All variables in C that are declared inside the block, are automatic variables by default. We can explicitly declare an automatic variable using auto keyword.

```
void main(){
int x=10;//local variable (also automatic)
auto int y=20;//automatic variable
}
```

External Variable

We can share a variable in multiple C source files by using an external variable. To declare an external variable, you need to use extern keyword.

myfile.h

```
extern int x=10;//external variable (also global)
```

program1.c

```
#include "myfile.h"
#include <stdio.h>

void printValue(){
    printf("Global variable: %d", global_variable);
}
```

C Program to Print Value of a Variable

Example:

```
#include<stdio.h>

void main()
{
    /* c program to print value of a variable */ int age = 33;
    printf("I am %d years old.\n", age);
}
```

Program Output:

```
I am 33 years old.
```

C Delimiters

- These are the symbols which has some syntactic meaning and has got significance.
- These will not specify any operations.
- These cannot be used for some other purpose.
- C language delimiters list is show below.

SYMBOL	NAME	MEANING
#	Hash	Pre processor directive
,	Comma	Variable delimiter used to separate
•	Colon	Label delimiters
;	Semi colon	Statement delimiters
0	Parenthesis	Used in expressions or in function
{}	Curly braces	Used for blocking c structure
	Square braces	Used along with arrays
