UNIT V

MULTITHREADING IN JAVA

Exception handling in try catch finally in Java

1. Control flow in try-catch clause OR try-catch-finally clause

- **Case 1:** Exception occurs in try block and handled in catch block
- **Case 2:** Exception occurs in try-block is not handled in catch block
- **Case 3:** Exception doesn't occur in try-block

2. try-finally clause

- **Case 1:** Exception occurs in try block
- **Case 2:** Exception doesn't occur in try-block
-

CONTROL FLOW IN TRY-CATCH OR TRY-CATCH-FINALLY

1. Exception occurs in try block and handled in catch block: If a statement in try block raised an exception, then the rest of the try block doesn't execute and control passes to the **corresponding** catch block. After executing the catch block, the control will be transferred to finally block(if present) and then the rest program will be executed.

- **Control flow in try-catch:**

```
// Java program to demonstrate control flow of try-catch clause when exception occur in try block
// and handled in catch block
class GFG
{
    public static void main (String[] args)
    {
        // array of size 4.
        int[] arr = new int[4];
        try
        {
            int i = arr[4];

            // this statement will never execute
            // as exception is raised by above statement
            System.out.println("Inside try block");
        }
    }
}
```

```

    }
    catch(ArrayIndexOutOfBoundsException ex)
    {
        System.out.println("Exception caught in Catch block");
    }

    // rest program will be executed
    System.out.println("Outside try-catch clause");
}
}

```

Output

```

Exception caught in Catch block
Outside try-catch clause

```

- **Control flow in try-catch-finally clause :**

```

// Java program to demonstrate control flow of try-catch-finally clause when exception occur in try
//block and handled in catch block
class GFG
{
    public static void main (String[] args)
    {
        // array of size 4.
        int[] arr = new int[4];
        try
        {
            int i = arr[4];
            // this statement will never execute as exception is raised by above statement
            System.out.println("Inside try block");
        }
        catch(ArrayIndexOutOfBoundsException ex)
        {
            System.out.println("Exception caught in catch block");
        }
        finally
        {
            System.out.println("finally block executed");
        }
        // rest program will be executed
        System.out.println("Outside try-catch-finally clause");
    }
}

```

Output

Exception caught in catch block
finally block executed
Outside try-catch-finally clause

2. Exception occurred in try-block is not handled in catch block: In this case, the default handling mechanism is followed. If finally block is present, it will be executed followed by the default handling mechanism.

- **try-catch clause :**

```
// Java program to demonstrate
// control flow of try-catch clause
// when exception occurs in try block
// but not handled in catch block
class GFG
{
    public static void main (String[] args)
    {
        // array of size 4.
        int[] arr = new int[4];
        try
        {
            int i = arr[4];

            // this statement will never execute
            // as exception is raised by above statement
            System.out.println("Inside try block");
        }
        // not a appropriate handler
        catch(NullPointerException ex)
        {
            System.out.println("Exception has been caught");
        }
        // rest program will not execute
        System.out.println("Outside try-catch clause");
    }
}
```

Run Time Error:

```
Exception in thread "main" java.lang.ArrayIndexOutOfBoundsException: 4
    at GFG.main(GFG.java:12)
```

- **try-catch-finally clause :**

```
// Java program to demonstrate control flow of try-catch-finally clause when exception occur in try //
// block but not handled in catch block
```

```

class GFG
{
    public static void main (String[] args)
    {

        // array of size 4.
        int[] arr = new int[4];

        try
        {
            int i = arr[4];

            // this statement will never execute
            // as exception is raised by above statement
            System.out.println("Inside try block");
        }
        // not a appropriate handler
        catch(NullPointerException ex)
        {
            System.out.println("Exception has been caught");
        }
        finally
        {
            System.out.println("finally block executed");
        }
        // rest program will not execute
        System.out.println("Outside try-catch-finally clause");
    }
}

```

Output :

```
finally block executed
```

Run Time error:

```
Exception in thread "main" java.lang.ArrayIndexOutOfBoundsException: 4
    at GFG.main(GFG.java:12)
```

3. Exception doesn't occur in try-block: In this case catch block never runs as they are only meant to be run when an exception occurs. finally block(if present) will be executed followed by rest of the program.

- **try-catch clause :**

```
// Java program to demonstrate try-catch
```

```

// when an exception doesn't occurred in try block
class GFG
{
    public static void main (String[] args)
    {
        try
        {
            String str = "123";
            int num = Integer.parseInt(str);
            // this statement will execute
            // as no any exception is raised by above statement
            System.out.println("Inside try block");
        }
        catch(NumberFormatException ex)
        {
            System.out.println("catch block executed...");
        }
        System.out.println("Outside try-catch clause");
    }
}

```

Output

```

Inside try block
Outside try-catch clause

```

- **try-catch-finally clause**

```

// Java program to demonstrate try-catch-finally
// when exception doesn't occurred in try block
class GFG
{
    public static void main (String[] args)
    {
        try
        {
            String str = "123";
            int num = Integer.parseInt(str);
            // this statement will execute
            // as no any exception is raised by above statement
            System.out.println("try block fully executed");
        }
        catch(NumberFormatException ex)
        {
            System.out.println("catch block executed...");
        }
    }
}

```

```

    }
    finally
    {
        System.out.println("finally block executed");
    }
    System.out.println("Outside try-catch-finally clause");
}
}

```

Output

```

try block fully executed
finally block executed
Outside try-catch-finally clause

```

Control flow in try-finally

In this case, no matter whether an exception occurs in try-block or not **finally will always be executed**. But control flow will depend on whether an exception has occurred in the try block or not.

1. **Exception raised:** If an exception has occurred in the try block then the control flow will be finally block followed by the default exception handling mechanism.

```

// Java program to demonstrate control flow of try-finally clause when exception occurs in try block
class GFG
{
    public static void main (String[] args)
    {

        // array of size 4.
        int[] arr = new int[4];
        try
        {
            int i = arr[4];
            // this statement will never execute
            // as exception is raised by above statement
            System.out.println("Inside try block");
        }
        finally
        {
            System.out.println("finally block executed");
        }
        // rest program will not execute
    }
}

```

```
        System.out.println("Outside try-finally clause");
    }
}
```

Output :

```
finally block executed
Exception in thread "main" java.lang.ArrayIndexOutOfBoundsException: 4
    at GFG.main(GFG.java:11)
```

2. Exception not raised: If an exception does not occur in the try block then the control flow will be finally block followed by the rest of the program

```
// Java program to demonstrate control flow of try-finally when exception doesn't occur in try block
class GFG
{
    public static void main (String[] args)
    {
        try
        {
            String str = "123";
            int num = Integer.parseInt(str);
            // this statement will execute
            // as no any exception is raised by above statement
            System.out.println("Inside try block");
        }
        finally
        {
            System.out.println("finally block executed");
        }
        // rest program will be executed
        System.out.println("Outside try-finally clause");
    }
}
```

Output

```
Inside try block
finally block executed
Outside try-finally clause
```
