

SNS COLLEGE OF TECHNOLOGY

Coimbatore-36. An Autonomous Institution

Accredited by NBA – AICTE and Accredited by NAAC – UGC with 'A+' Grade Approved by AICTE, New Delhi & Affiliated to Anna University, Chennai

COURSE NAME: 23CST101 PROBLEM SOLVING AND C PROGRAMMING I YEAR/ V SEMESTER

UNIT – IV POINTERS

Pointers and Arrays

Department of Computer Science and Engineering

UNIT IV

Pointers - Definition - Initialization - Operations on pointers-Pointer arithmetic - Pointers and arrays - Illustrative programs.

Relationship Between Arrays and Pointers

An array is a block of sequential data. Let's write a program to print addresses of array elements.

```
#include <stdio.h>
int main() {
  int x[4];
  int i;
  for(i = 0; i < 4; ++i) {
      printf("&x[%d] = %p\n", i, &x[i]);
   printf("Address of array x: %p", x);
   return 0;
```

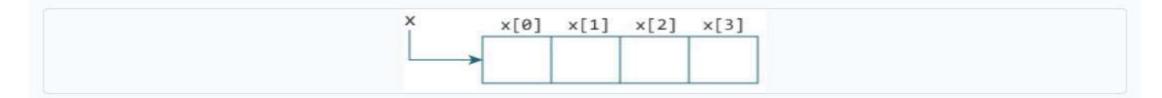

Output

```
&x[0] = 1450734448
&x[1] = 1450734452
&x[2] = 1450734456
&x[3] = 1450734460
Address of array x: 1450734448
```

Notice that, the address of $&\times[0]$ and \times is the same. It's because the variable name \times points to the first element of the array.

From the above example, it is clear that $[8\times[0]]$ is equivalent to $[\times]$. And, $[\times[0]]$ is equivalent to $[\times]$.

Similarly,

- &x[1] is equivalent to x+1 and x[1] is equivalent to *(x+1).
- &x[2] is equivalent to x+2 and x[2] is equivalent to *(x+2).
- ...
- Basically, &x[i] is equivalent to x+i and x[i] is equivalent to *(x+i).

Example 1: Pointers and Arrays

```
#include <stdio.h>
int main() {
  int i, x[6], sum = 0;
  printf("Enter 6 numbers: ");
 for(i = 0; i < 6; ++i) {
  // Equivalent to scanf("%d", &x[i]);
      scanf("%d", x+i);
  // Equivalent to sum += x[i]
      sum += *(x+i);
  printf("Sum = %d", sum);
  return 0;
```

When you run the program, the output will be:

```
Enter 6 numbers: 2
3
4
12
4
Sum = 29
```

Example 2: Arrays and Pointers

```
#include <stdio.h>
int main() {
  int x[5] = \{1, 2, 3, 4, 5\};
  int* ptr;
  // ptr is assigned the address of the third element
  ptr = &x[2];
  printf("*ptr = %d \n", *ptr); // 3
  printf("*(ptr+1) = %d \n", *(ptr+1)); // 4
  printf("*(ptr-1) = %d", *(ptr-1)); // 2
  return 0;
```

When you run the program, the output will be:

```
*ptr = 3
*(ptr+1) = 4
*(ptr-1) = 2
```

In this example, <code>&x[2]</code> , the address of the third element, is assigned to the <code>ptr</code> pointer. Hence, <code>3</code> was displayed when we printed <code>*ptr</code> .

And, printing *(ptr+1) gives us the fourth element. Similarly, printing *(ptr-1) gives us the second element.

C Pointers

Pointers are powerful features of C and C++ programming. Before we learn pointers, let's learn about addresses in C programming.

Address in C

If you have a variable var in your program, &var will give you its address in the memory.

We have used address numerous times while using the scanf() function.

scanf("%d", &var);

Here, the value entered by the user is stored in the address of var variable. Let's take a working example.

```
#include <stdio.h>
int main()
  int var = 5;
  printf("var: %d\n", var);
  // Notice the use of & before var
  printf("address of var: %p", &var);
  return 0;
```

Output

var: 5

address of var: 2686778

C Pointers

Pointers (pointer variables) are special variables that are used to store addresses rather than values.

Pointer Syntax

Here is how we can declare pointers.

```
int* p;
```

Here, we have declared a pointer p of int type.

You can also declare pointers in these ways.

```
int *p1;
int * p2;
```

Let's take another example of declaring pointers.

```
int* p1, p2;
```

Here, we have declared a pointer p1 and a normal variable p2.

Assigning addresses to Pointers

Let's take an example.

```
int* pc, c;
c = 5;
pc = &c;
```

Here, 5 is assigned to the c variable. And, the address of c is assigned to the pc pointer.

Get Value of Thing Pointed by Pointers

To get the value of the thing pointed by the pointers, we use the * operator. For example:

```
int* pc, c;
c = 5;
pc = &c;
printf("%d", *pc); // Output: 5
```

Here, the address of c is assigned to the pc pointer. To get the value stored in that address, we used *pc.

Note: In the above example, pc is a pointer, not *pc. You cannot and should not do something like *pc = &c;

By the way, * is called the dereference operator (when working with pointers). It operates on a pointer and gives the value stored in that pointer.

Changing Value Pointed by Pointers

Let's take an example.

```
int* pc, c;
c = 5;
pc = &c;
c = 1;
printf("%d", c);  // Output: 1
printf("%d", *pc);  // Ouptut: 1
```

We have assigned the address of c to the pc pointer.

Then, we changed the value of c to 1. Since pc and the address of c is the same, *pc gives us 1.

Let's take another example.

```
int* pc, c;
c = 5;
pc = &c;
*pc = 1;
printf("%d", *pc); // Ouptut: 1
printf("%d", c); // Output: 1
```

We have assigned the address of c to the pc pointer.

Then, we changed *pc to 1 using *pc = 1; . Since pc and the address of c is the same, c will be equal to 1.

Example: Working of Pointers

Let's take a working example.

```
#include <stdio.h>
int main()
  int* pc, c;
   c = 22;
   printf("Address of c: %p\n", &c);
   printf("Value of c: %d\n\n", c); // 22
   pc = &c;
   printf("Address of pointer pc: %p\n", pc);
   printf("Content of pointer pc: %d\n\n", *pc); // 22
   c = 11;
   printf("Address of pointer pc: %p\n", pc);
   printf("Content of pointer pc: %d\n\n", *pc); // 11
   *pc = 2;
   printf("Address of c: %p\n", &c);
   printf("Value of c: %d\n\n", c); // 2
   return 0;
```

Output

Address of c: 2686784

Value of c: 22

Address of pointer pc: 2686784

Content of pointer pc: 22

Address of pointer pc: 2686784

Content of pointer pc: 11

Address of c: 2686784

Value of c: 2
