

SNS COLLEGE OF TECHNOLOGY

Coimbatore-35.

An Autonomous Institution

COURSE NAME : 23CSE201 OPERATING SYSTEMS

II YEAR/ IV SEMESTER

UNIT-I OVERVIEW AND PROCESS MANAGEMENT

Topic: Architecture, Operations

Dr.B.Vinodhini
Associate Professor
Department of Computer Science and Engineering

SNS COLLEGE OF TECHNOLOGY

(Autonomous)
COIMBATORE-35

Operating Systems

Introduction- Storage Structure

- Main Memory(RAM) implemented in Semi Conductor Technology(DRAM)
- Interaction is achieved through *Load or Store* instructions

I/O Structure

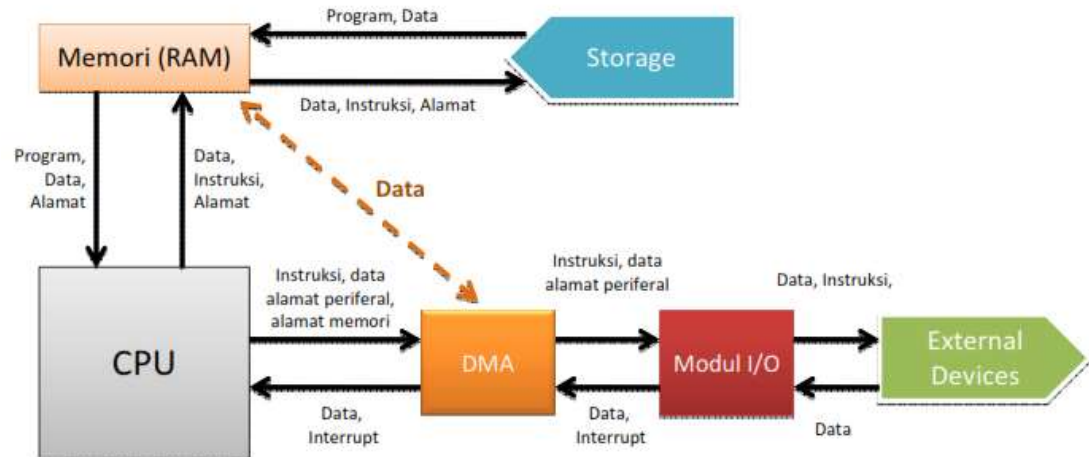

- After I/O starts, control returns to user program only upon I/O completion
 - Wait instruction idles the CPU until the next interrupt
 - Wait loop (contention for memory access)
 - At most one I/O request is outstanding at a time, no simultaneous I/O processing

- After I/O starts, control returns to user program without waiting for I/O completion
 - **System call** – request to the operating system to allow user to wait for I/O completion
 - **Device-status table** contains entry for each I/O device indicating its type, address, and state
 - Operating system indexes into I/O device table to determine device status and to modify table entry to include interrupt

Directory Memory Access

- Used for high-speed I/O devices able to transmit information at close to memory speeds
- Device controller transfers blocks of data from buffer storage directly to main memory without CPU intervention
- Only one interrupt is generated per block, rather than the one interrupt per byte

Storage Structure

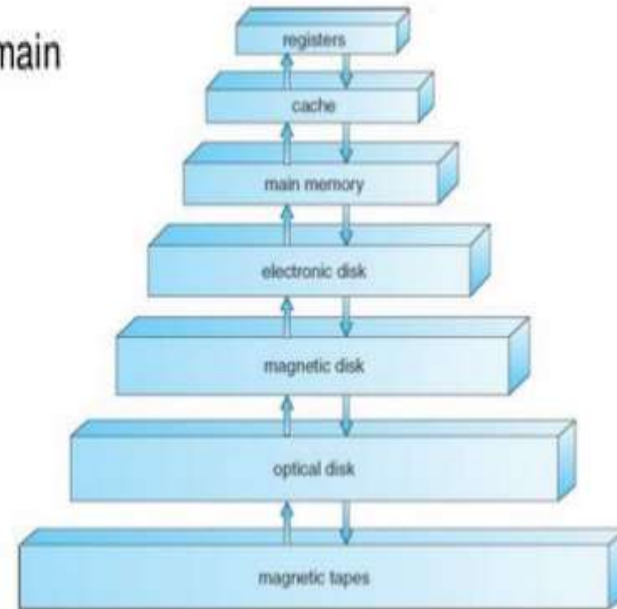

- Main memory – only large storage media that the CPU can access directly
 - **Random access**
 - Typically **volatile**
- Secondary storage – extension of main memory that provides large **nonvolatile** storage capacity

- Magnetic disks – rigid metal or glass platters covered with magnetic recording material
 - Disk surface is logically divided into **tracks**, which are subdivided into **sectors**
 - The **disk controller** determines the logical interaction between the device and the computer

Storage Hierarchy

- Storage systems organized in hierarchy
 - Speed
 - Cost
 - Volatility
- **Caching** – copying information into faster storage system; main memory can be viewed as a *cache* for secondary storage

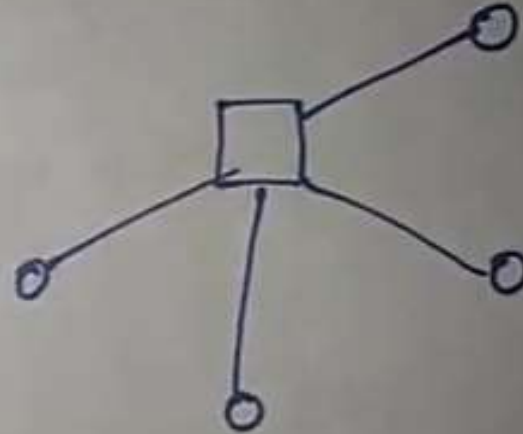

Introduction-User View

OS \Rightarrow User-view

PC \Rightarrow convenience

Mainframe

\Rightarrow effective
utilization
of
H/w.

Handheld \Rightarrow convenience
+
efficiency.

Introduction

Computer System Architecture

Computer System Architecture

Based on the no. of gen. purpose processors used we have 3 types of computer system —

- * Single Processor System
- * Multi Processor System
- * Clustered System

Introduction

- * Single Processor System \Rightarrow 1 GPP
 - * Multi Processor System \Rightarrow >1 GPP
 - * Clustered System \Rightarrow >1 GPP.
- Spl purpose processor } GPU

1 computer
with
multiple
processor

Server-client

Computer System Architecture

Multiprocessor Systems

Multiprocessor System — Tightly Coupled / Parallel System.

Advantages —

1. Increased throughput
2. Inexpensive, comparatively.
3. Increased reliability.

Computer System Architecture

Multiprocessor Systems

1 comp \Rightarrow multi processors

(Speed up ratio 'N' processor) $< N$

1 mem.

N

N systems.

SPS - 't' $>$ $\frac{t}{N}$

1 processor

MPP \Rightarrow 'n'

(n-1)

Computer System Architecture

Multiprocessor Systems

Graceful degradation \Rightarrow Catastrophic failure.

Speed \propto surviving components.

ex: Tandem System (HP Non Stop System)

n processors — duplicates

' $2n$ '

\Rightarrow each pair performs task

Computer System Architecture

Multiprocessor Systems

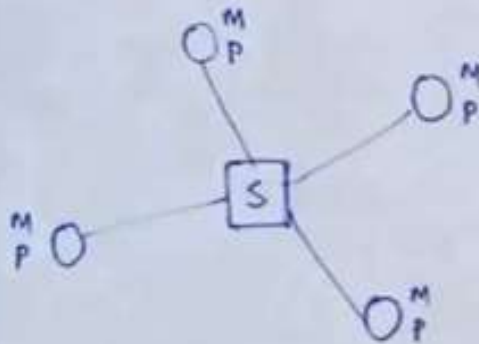

Computer System Architecture

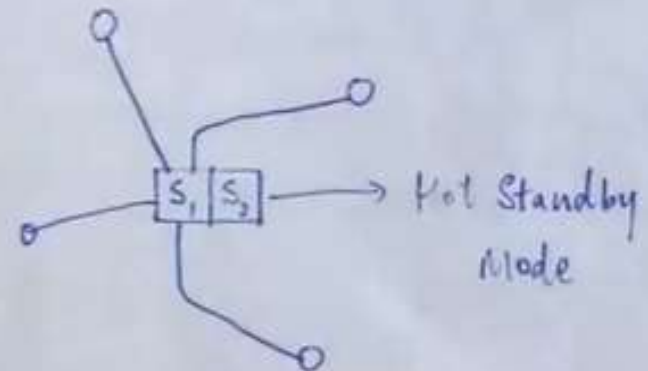

Clustered Systems

Clustered System - Loosely coupled.

Node

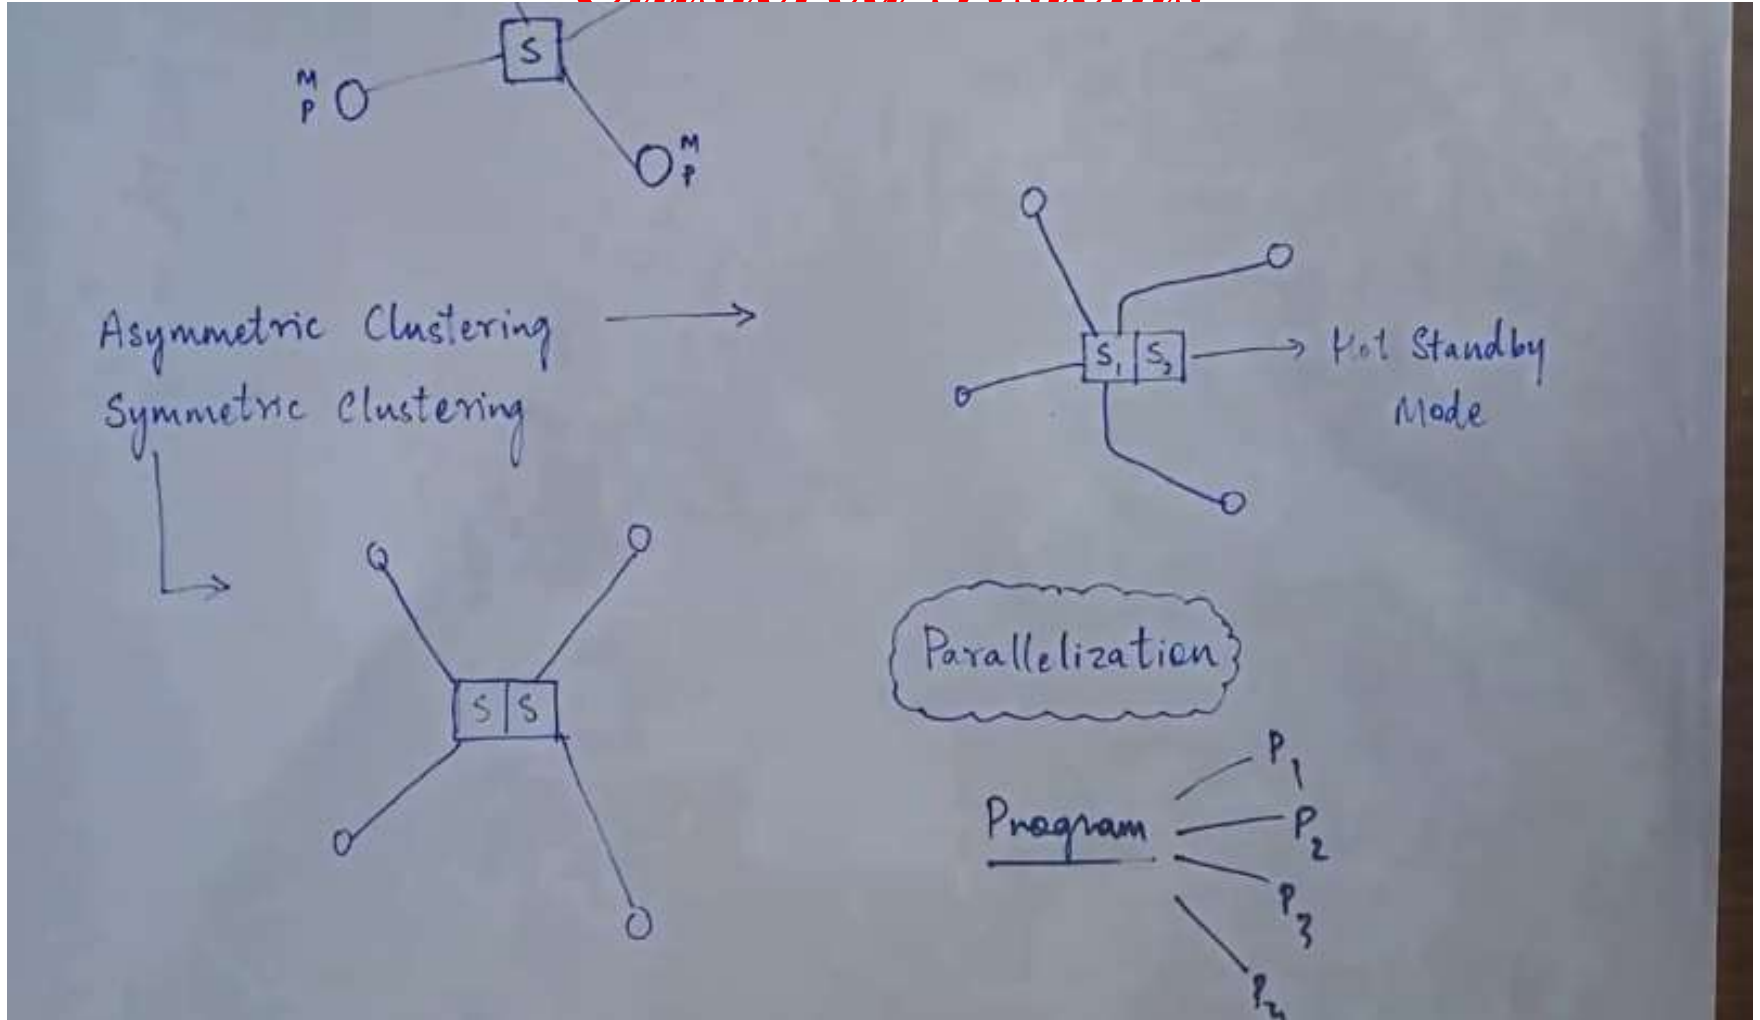

Asymmetric Clustering →
Symmetric Clustering

Computer System Architecture

Clustered Systems

Operating System Structure

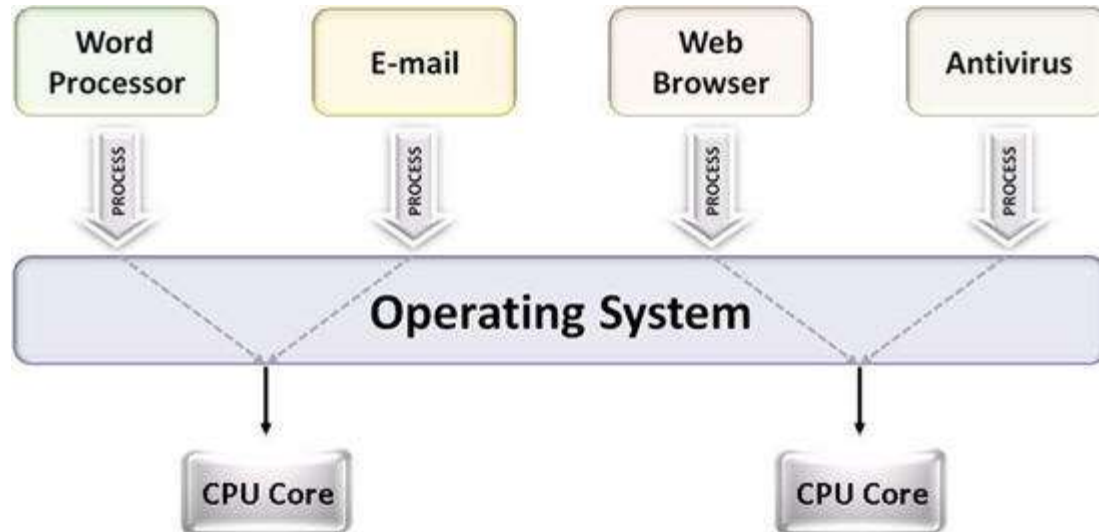

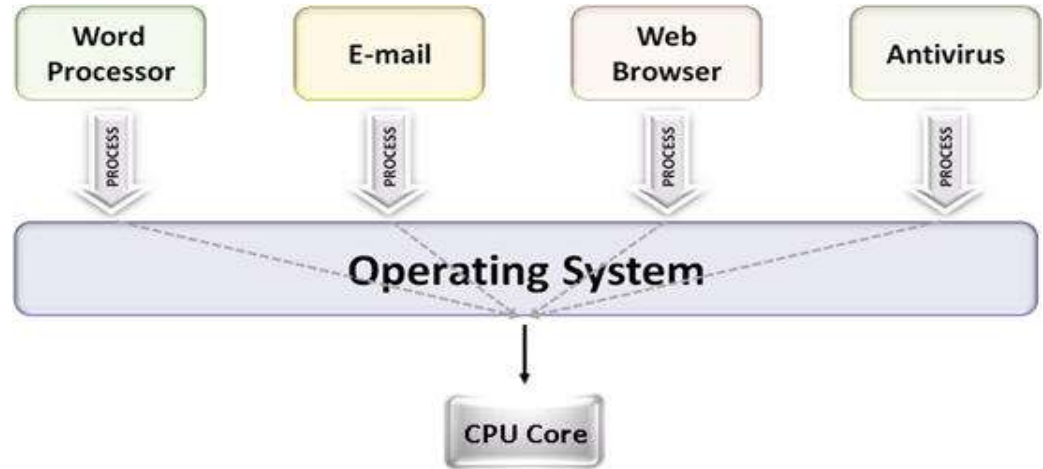

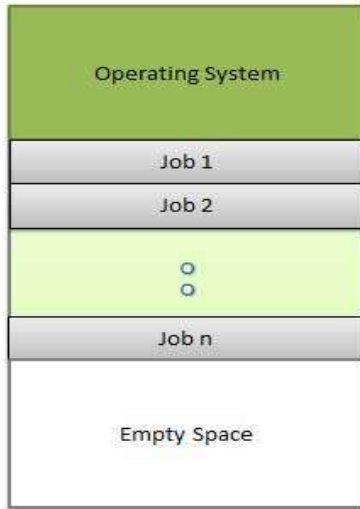

- **Multiprogramming** needed for efficiency
 - Single user cannot keep CPU and I/O devices busy at all times
 - Multiprogramming organizes jobs (code and data) so CPU always has one to execute
 - A subset of total jobs in system is kept in memory
 - One job selected and run via **job scheduling**
 - When it has to wait (for I/O for example), OS switches to another job

- **Timesharing (multitasking)** is logical extension in which CPU switches jobs so frequently that users can interact with each job while it is running, creating **interactive** computing
 - **Response time** should be < 1 second
 - Each user has at least one program executing in memory ⇒ **process**
 - If several jobs ready to run at the same time ⇒ **CPU scheduling**
 - If processes don't fit in memory, **swapping** moves them in and out to run
 - **Virtual memory** allows execution of processes not completely in memory

Operating System Architecture

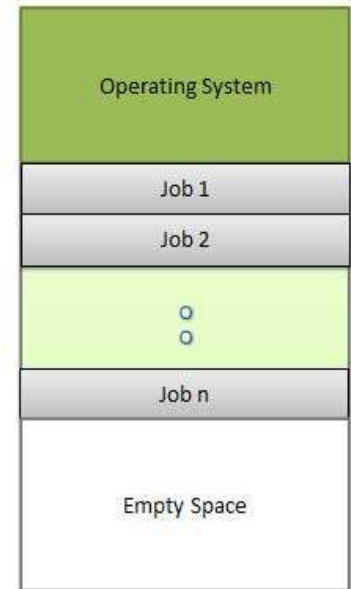

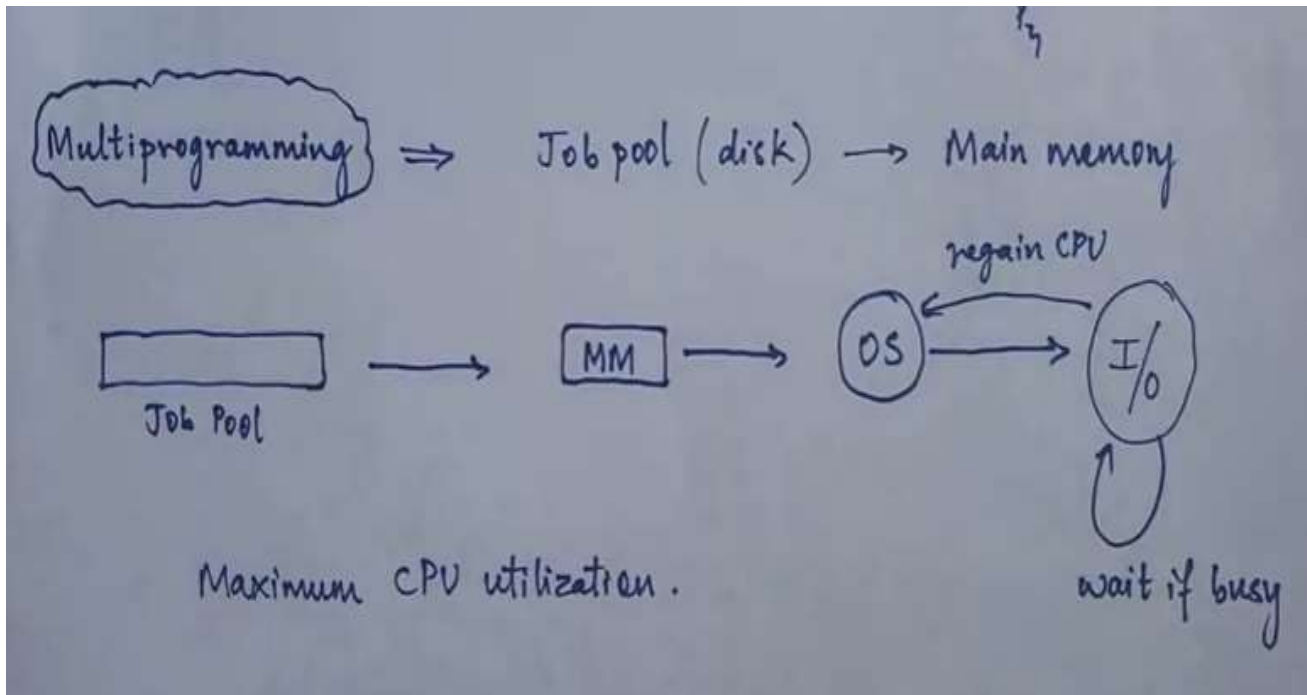

Multiprogramming

Operating System Architecture

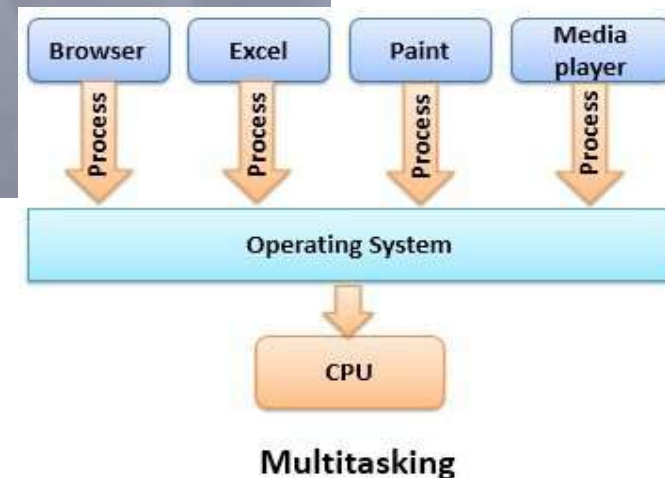

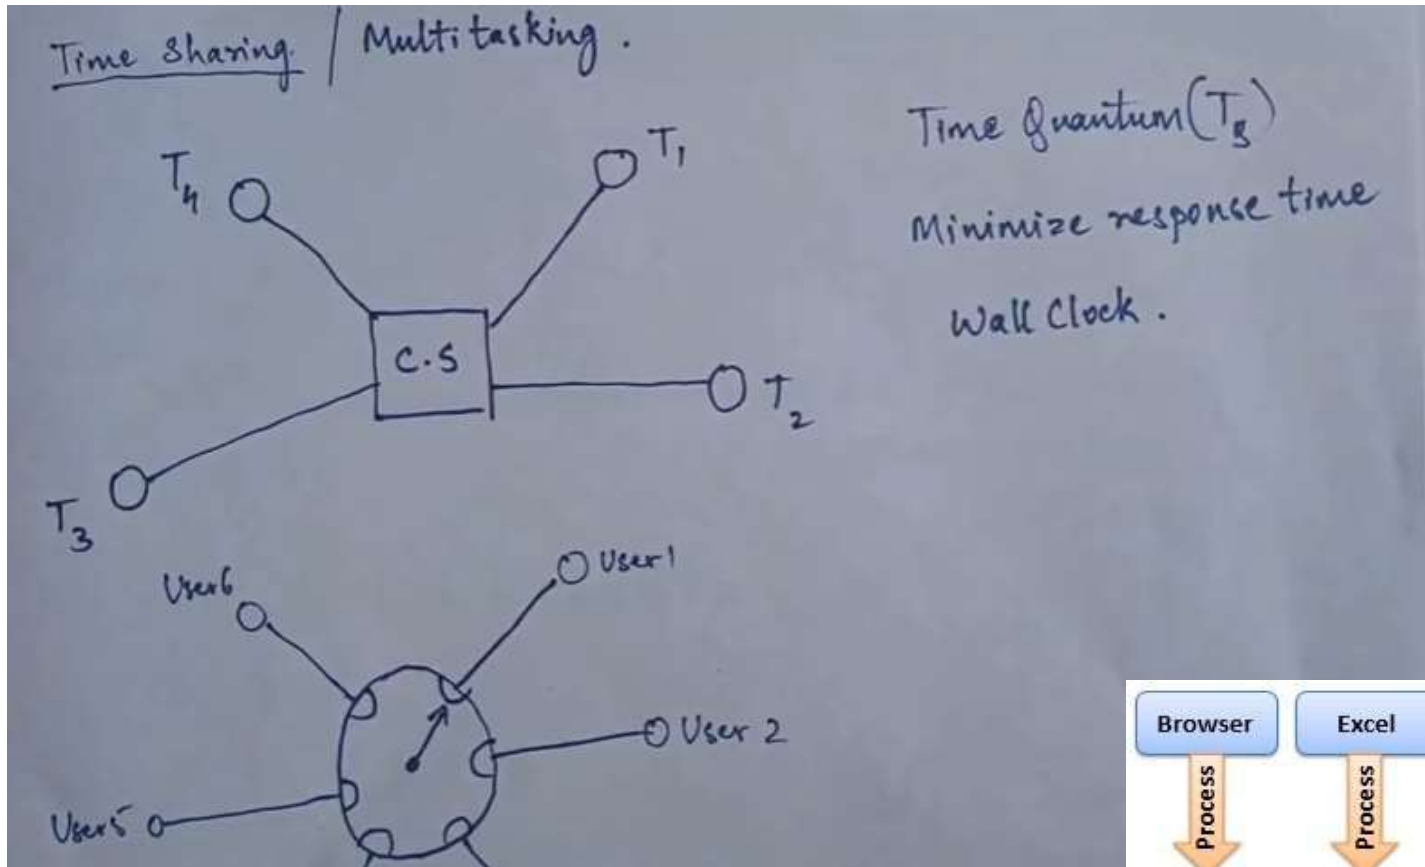

Multiprogramming

Operating System Architecture

Time Sharing Systems

Operating System Operation

Dual Mode Operation

Dual Mode Operation.

OS = Interrupt-driven.

trap \rightarrow S/W generated interrupt

Error in User process \rightarrow error is OS process.

Mode Bit $\begin{cases} 0 - \text{K. mode} \\ 1 - \text{U. mode} \end{cases}$

System Boot

K.M \rightarrow OS loads \rightarrow User apps (User mode)

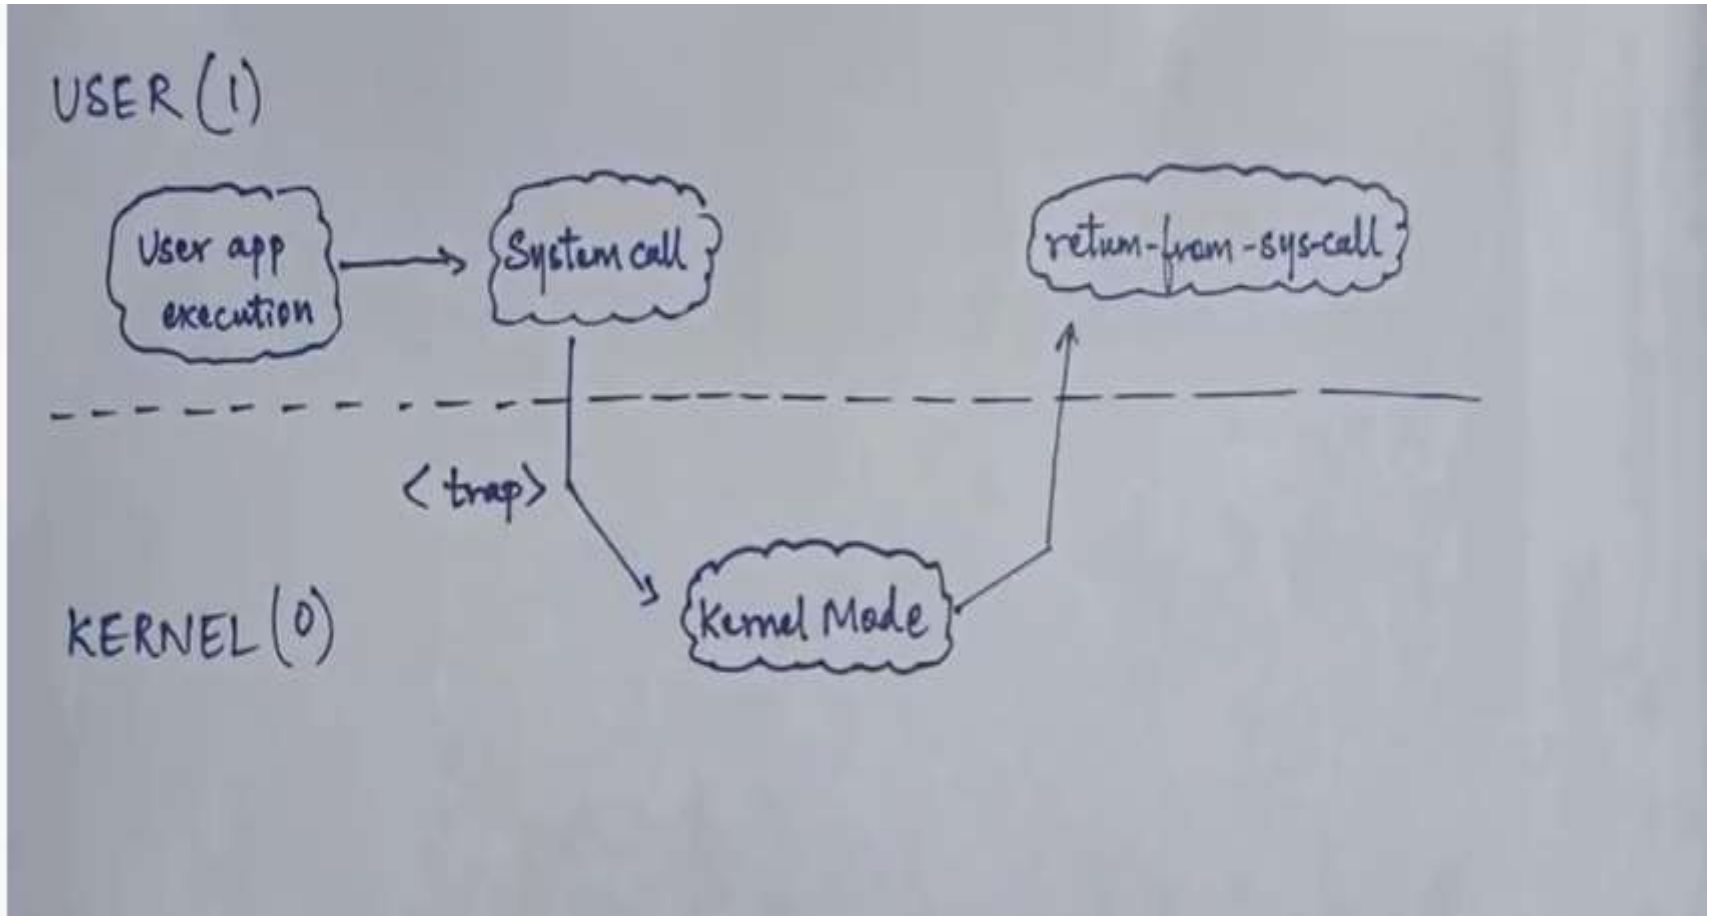

K.M \leftarrow OS \leftarrow system call (trap)

Operating System Operation

Dual Mode Operation

Computing Environment

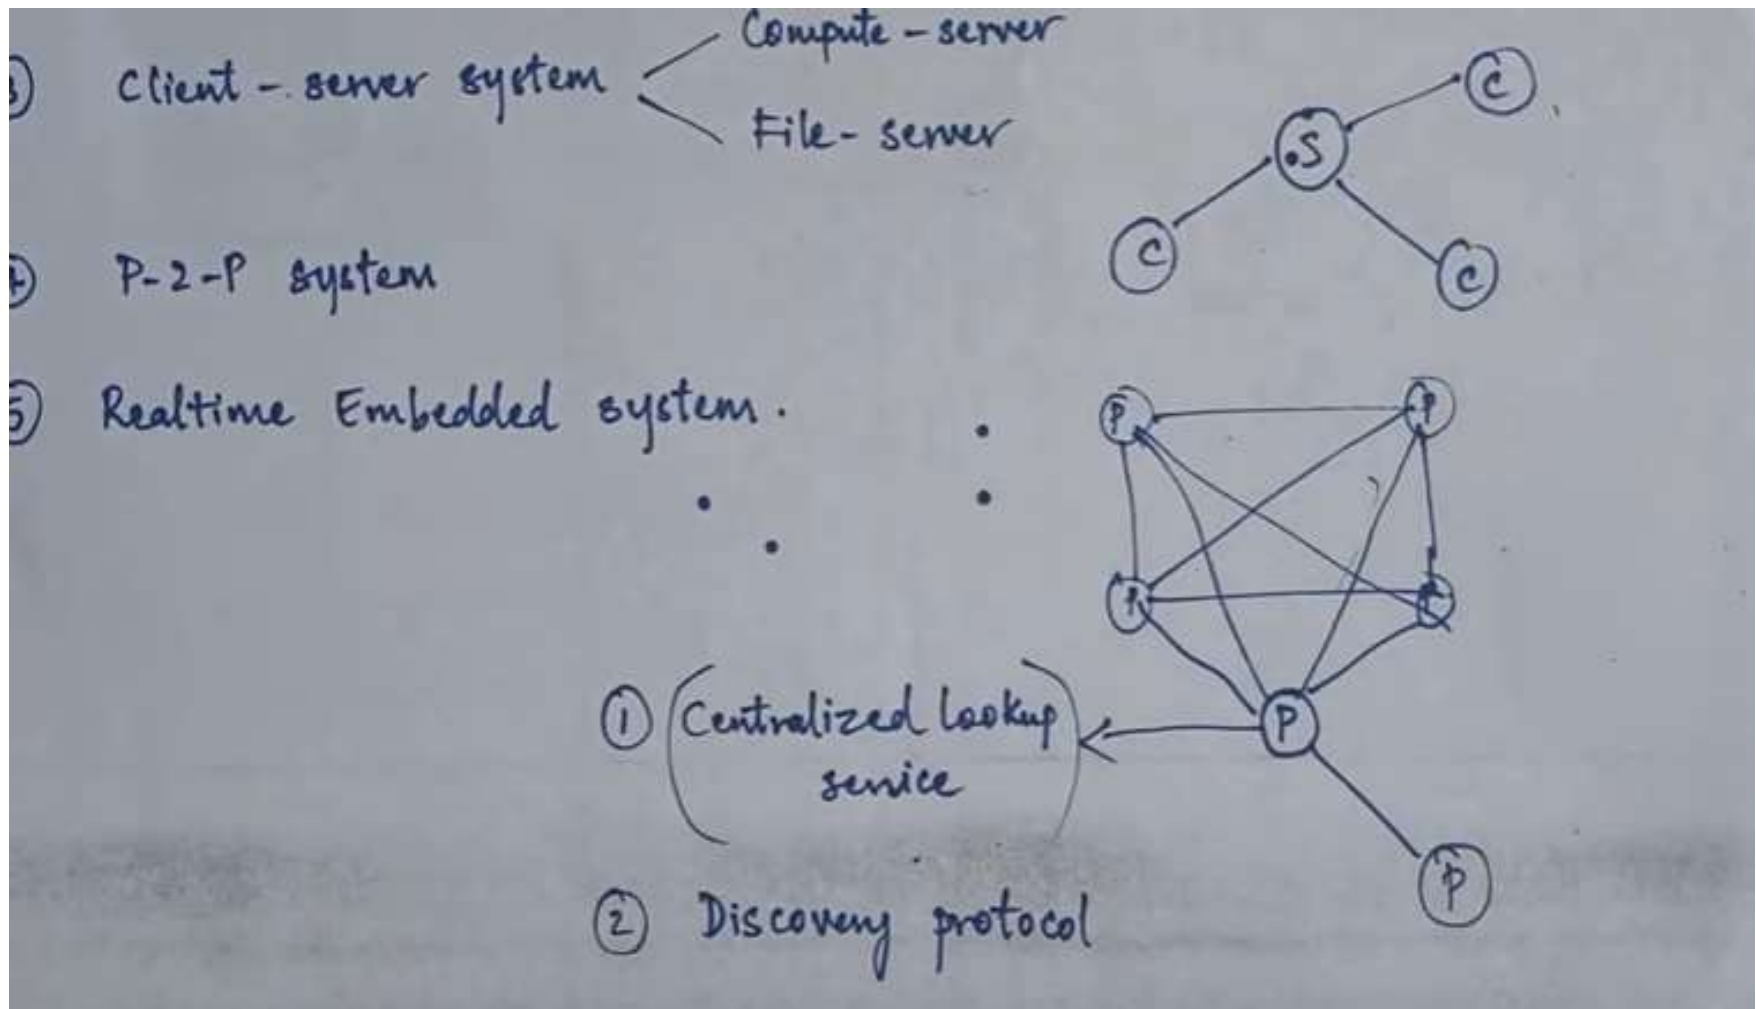

Different Computing envts

- ① Distributed systems
 - LAN
 - WAN
 - MAN
 - PAN
- ② Network-operation system
- ③ Client-server system
 - Compute-server
 - File-server
- ④ P-2-P system
- ⑤ Realtime Embedded system.

Computing Environment

Summarization
