PHASE CHANGE HEAT TRANSFER AND HEAT EXCHANGERS

Topic - Types of Heat Exchangers- Heat Exchanger Analysis- LMTD Method

Heat exchangers are the devices that facilitate heat transfer between two (or) more fluids at different temperatures, while keeping them from mixing (or) without mixing. Heat transfer in heat exchanger involves convection in each fluid and conduction through the wall separating the fluids.

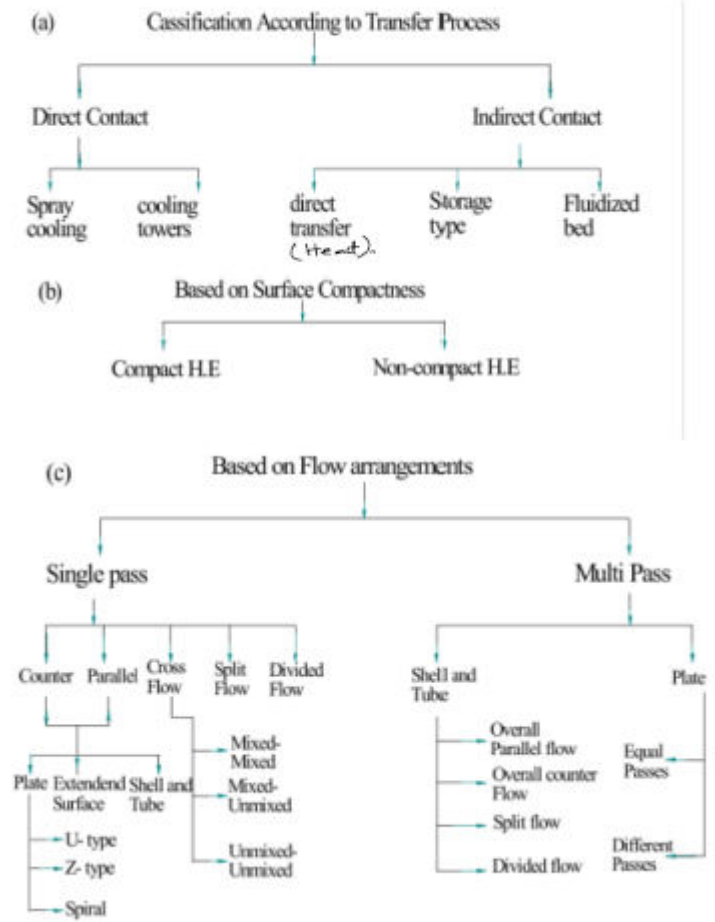

Examples: Shell and tube heat exchanger,
Boilers,
Cooling towers
Car radiators etc.,

Heat transfer analysis of heat exchangers

To design or predict the performance, the fluid temperatures, overall heat transfer coefficient and surface area parameters are to be evaluated. They are modelled as steady-flow devices. The methods used for analysis are:

1) LMTD approach (Log mean Temp difference)
Known \rightarrow Temperatures, Mass flow rates, overall heat transfer coefficient.

Calculate the size of the heat exchanger D, L .

2) ϵ -NTU approach: (Number of Transfer units).
Known \rightarrow either inlet or outlet temperatures, size.

Type and size of heat exchanger.
Calculate the missing temperatures, load on the heat exchanger.

LMTD for parallel flow heat exchanger

Heat capacity:

$C_h = \dot{m}_h C_{ph}$

$C_c = \dot{m}_c C_{pc}$

i = inlet //
o = outlet //

Temp vs dist.

$\Delta T_1 = T_{hi} - T_{ci}$

$\Delta T_2 = T_{ho} - T_{co}$

$T_{hi} > T_{ho}$
 $T_{co} > T_{ci}$

Assumptions: [Both parallel & counter flow HEs] (X)

- 1) Steady flow.
- 2) KE and PE are neglected.
- 3) Thermo physical properties are constant over the entire length of HE.
- 4) No heat loss to the surrounding (adiabatic)
- 5) Heat transfer coefficient is constant over the entire length.

DEPARTMENT OF MECHANICAL ENGINEERING, 19MEB302/ Heat and Mass Transfer – UNIT III -
PHASE CHANGE HEAT TRANSFER AND HEAT EXCHANGERS

Topic - Types of Heat Exchangers- Heat Exchanger Analysis- LMTD Method

Let, $A =$ Surface area in m^2 .

$\dot{m}_c, \dot{m}_h =$ Mass flow rate in kg/s .

$\Delta T = T_h - T_c =$ Local temperature difference b/w hot and cold fluids in $^{\circ}C$ or K .

$U =$ Overall heat transfer coefficient.

Applying the energy balance: (hot & cold fluids)

$$Q = \underbrace{\dot{m}_c}_{C_c} C_{pc} (T_{c0} - T_{c1}) = \underbrace{\dot{m}_h}_{C_h} C_{ph} (T_{h1} - T_{h0}) \rightarrow \textcircled{1}$$

Heat capacities are.

$$C_c = \dot{m}_c C_{pc} \text{ and } C_h = \dot{m}_h C_{ph}. \rightarrow \textcircled{2}$$

Rate of heat transfer dQ from the hot to the cold fluid through an elemental area dA is given by:

$$dQ = U \cdot dA \cdot dT \rightarrow \textcircled{3} \quad [Q = UA \Delta T].$$

Also, dQ should be equal to the heat given up by the hot fluid (or) gained by the cold fluid flowing through an elemental area dA , is.

$$dQ = \dot{m}_c C_{pc} dT_c - \dot{m}_h C_{ph} dT_h \rightarrow \textcircled{4}$$

[-ve sign due to heat lost by the hot fluid] \textcircled{X}

Topic - Types of Heat Exchangers- Heat Exchanger Analysis- LMTD Method

Rewriting the above equations

$$dT_c = \frac{dQ}{\dot{m}_c C_{pc}} \text{ and } dT_h = -\frac{dQ}{\dot{m}_h C_{ph}} \rightarrow \textcircled{5}$$

If, $\Delta T_1 = T_{hi} - T_{ci}$ and $\Delta T_2 = T_{ho} - T_{co}$, then.

$$dT_h - dT_c = -\frac{dQ}{\dot{m}_h C_{ph}} - \frac{dQ}{\dot{m}_c C_{pc}}$$

$$d(T_h - T_c) = -dQ \left[\frac{1}{\dot{m}_h C_{ph}} + \frac{1}{\dot{m}_c C_{pc}} \right] \rightarrow \textcircled{6}$$

Substitute $\textcircled{5}$ in $\textcircled{6}$, we get.

$$d(T_h - T_c) = -U dA dT \left[\frac{1}{\dot{m}_h C_{ph}} + \frac{1}{\dot{m}_c C_{pc}} \right]$$

Integrating between inlet and outlet.

$$\int_{\text{inlet}=\Delta T_1}^{\text{outlet}=\Delta T_2} \frac{d(T_h - T_c)}{dT} = -\int_{\text{inlet}}^{\text{out}} U \cdot dA \left[\frac{1}{\dot{m}_h C_{ph}} + \frac{1}{\dot{m}_c C_{pc}} \right]$$

$$\ln \left(\frac{T_{ho} - T_{co}}{T_{hi} - T_{ci}} \right) = -UA \left[\frac{1}{\dot{m}_h C_{ph}} + \frac{1}{\dot{m}_c C_{pc}} \right]$$

Substituting for $\dot{m}_h C_{ph}$ & $\dot{m}_c C_{pc}$ from $\textcircled{1}$, we get.

$$\ln \left(\frac{T_{ho} - T_{co}}{T_{hi} - T_{ci}} \right) = -UA \left[\frac{T_{hi} - T_{ho}}{Q} + \frac{T_{co} - T_{ci}}{Q} \right]$$

DEPARTMENT OF MECHANICAL ENGINEERING, 19MEB302/ Heat and Mass Transfer – UNIT III -
PHASE CHANGE HEAT TRANSFER AND HEAT EXCHANGERS

Topic - Types of Heat Exchangers- Heat Exchanger Analysis- LMTD Method

$$\ln \left(\frac{T_{h_0} - T_{c_0}}{T_{h_i} - T_{c_i}} \right) = -\frac{UA}{Q} \left[T_{h_i} - T_{h_0} + T_{c_0} - T_{c_i} \right]$$

Rearranging the terms.

$$\ln \left(\frac{T_{h_0} - T_{c_0}}{T_{h_i} - T_{c_i}} \right) = -\frac{UA}{Q} \left[(T_{h_i} - T_{c_i}) - (T_{h_0} - T_{c_0}) \right]$$

$$\ln \left(\frac{T_{h_0} - T_{c_0}}{T_{h_i} - T_{c_i}} \right) = \frac{UA}{Q} \left[(T_{h_0} - T_{c_0}) - (T_{h_i} - T_{c_i}) \right]$$

$$\therefore Q = \frac{UA \left[(T_{h_0} - T_{c_0}) - (T_{h_i} - T_{c_i}) \right]}{\ln \left(\frac{T_{h_0} - T_{c_0}}{T_{h_i} - T_{c_i}} \right)}$$

$$Q = \frac{UA (\Delta T_2 - \Delta T_1)}{\ln \left(\frac{\Delta T_2}{\Delta T_1} \right)}$$

[OR]

$$Q = \frac{UA (\Delta T_1 - \Delta T_2)}{\ln \left(\frac{\Delta T_1}{\Delta T_2} \right)}$$

→ Logarithmic mean
