Vector Calculus

Scalar quantities $\frac{\partial \phi}{\partial x} \vec{i} + \frac{\partial \phi}{\partial y} \vec{j} + \frac{\partial \phi}{\partial z} \vec{k} = \nabla \phi$

A scalar quantity is that which has only magnitude and it is not related to any direction.

Vector quantities $(\cos \theta) \vec{i} + (\sin \theta) \vec{j} + (\cos \theta) \vec{k}$

A vector quantity is that which has both magnitude and direction.

Vector differential operator $\nabla = \vec{i} \frac{\partial}{\partial x} + \vec{j} \frac{\partial}{\partial y} + \vec{k} \frac{\partial}{\partial z}$

The vector differential operator is denoted by ∇ and it is defined by $\nabla = \vec{i} \frac{\partial}{\partial x} + \vec{j} \frac{\partial}{\partial y} + \vec{k} \frac{\partial}{\partial z}$

Note

- * $\vec{i} \times \vec{i} = \vec{j} \times \vec{j} = \vec{k} \times \vec{k} = 0$
- * $\vec{i} \times \vec{j} = \vec{j} \times \vec{k} = \vec{k} \times \vec{i} = \vec{i}$
- * $\vec{j} \times \vec{i} = \vec{k} \times \vec{j} = \vec{i} \times \vec{k} = -\vec{i}$

Gradient of a scalar point function

If $\phi(x, y, z)$ is a scalar point function and it is continuously differentiable then it is defined as

$$\nabla \phi = \vec{i} \frac{\partial \phi}{\partial x} + \vec{j} \frac{\partial \phi}{\partial y} + \vec{k} \frac{\partial \phi}{\partial z}$$

It is denoted as $\text{grad}(\phi)$ (or) $\nabla \phi$.

Problem 1

Find the gradient of ϕ , where $\phi = x^2 + y^2 + z^2$

$$\nabla\phi = \vec{i} \frac{\partial\phi}{\partial x} + \vec{j} \frac{\partial\phi}{\partial y} + \vec{k} \frac{\partial\phi}{\partial z}$$

$$= \vec{i} \frac{\partial}{\partial x} (x^2 + y^2 + z^2) + \vec{j} \frac{\partial}{\partial y} (x^2 + y^2 + z^2) + \vec{k} \frac{\partial}{\partial z} (x^2 + y^2 + z^2)$$

$$= \vec{i} (2x) + \vec{j} (2y) + \vec{k} (2z) \quad (\text{by } \div 2)$$

$$\nabla\phi = x\vec{i} + y\vec{j} + z\vec{k}$$

Problem 2

Find $\nabla\phi$ where $\phi = 3x^2y - y^3z^2$ at $(1, 1, 1)$

$$\nabla\phi = \vec{i} \frac{\partial\phi}{\partial x} + \vec{j} \frac{\partial\phi}{\partial y} + \vec{k} \frac{\partial\phi}{\partial z}$$

$$= \vec{i} \frac{\partial}{\partial x} (3x^2y - y^3z^2) + \vec{j} \frac{\partial}{\partial y} (3x^2y - y^3z^2) +$$

$$\vec{k} \frac{\partial}{\partial z} (3x^2y - y^3z^2)$$

$$= \vec{i} (6xy) + \vec{j} (3x^2 - 3y^2z^2) + \vec{k} (-2y^3z)$$

$$\nabla\phi = 6\vec{i} + 0\vec{j} - 2\vec{k}$$

$$\nabla\phi_{(1,1,1)} = 3\vec{i} + 0\vec{j} - \vec{k}$$

Problem 2

Find the directional derivative of $4xz^2 + xy^2$ at the point $(1, -2, 1)$ in the direction $2\vec{i} - \vec{j} - 2\vec{k}$

The directional derivative is $\frac{\nabla\phi \cdot \vec{a}}{|\vec{a}|}$

$$\nabla\phi = \vec{i}(4z^2 + 4z) + \vec{j}(xz) + \vec{k}(8xz + xy)$$

$$\nabla\phi = 2\vec{i} + \vec{j} + 6\vec{k}$$

$(1, -2, 1)$

$$|\vec{a}| = \sqrt{4+1+4}$$

$$|\vec{a}| = 3$$

\therefore The directional derivative is $\frac{(2\vec{i} + \vec{j} + 6\vec{k}) \cdot (2\vec{i} - \vec{j} - 2\vec{k})}{3}$
