

SNS COLLEGE OF TECHNOLOGY

DEPARTMENT OF AIML

23CST202- OPERATING SYSTEMS

II YEAR IV SEM AIML-B

UNIT 1 – OVERVIEW AND PROCESS MANAGEMENT

TOPIC – COMPUTER SYSTEM ARCHITECTURE AND OPERATION

Computer system Architecture

Types of Computer systems

- Based on number of General Purpose Processors :

- ① Single Processor
- ② Multi Processor
- ③ Clustered systems.

① Single Processor

- * One Main CPU executes general purpose instruction set including instructions from user processes.
- * Special Purpose Processors → device specific tasks

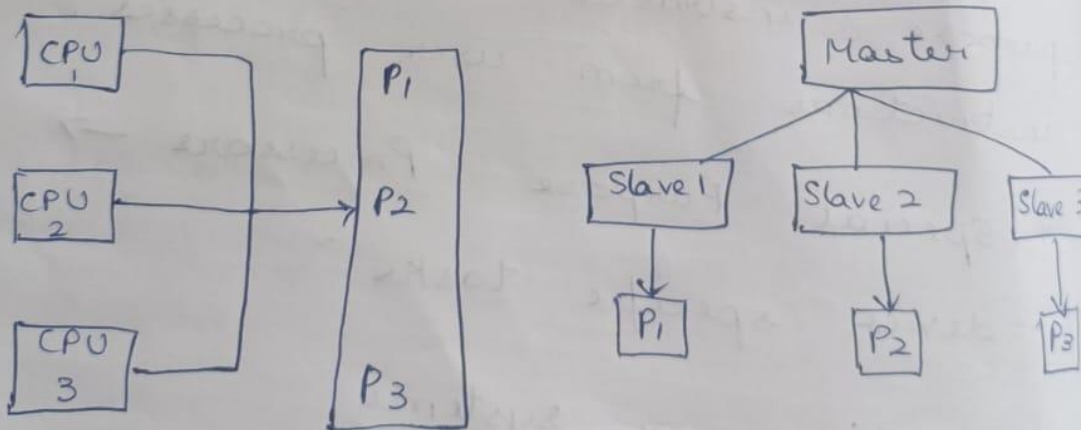

② Multiprocessor systems

- * Also called as Parallel systems or tightly coupled systems.

- * 2 or more processors, shared computer bus, sometimes shares clock, memory and peripheral devices
- * In close communication
- * Increased throughput
- * Economical
- * Increased reliability

Multi Processor systems

③ Clustered Systems

* Multiple CPU to accomplish computational work

* 2 or more systems coupled together.

* High availability

* Asymmetric or symmetric

↓
Hot Standby mode
other runs appls.

↓
2 or more host

symmetric is better.

DLM -
distributed lock manager
SAN
Storage area n/w

Beowulf clusters

Operating system structure

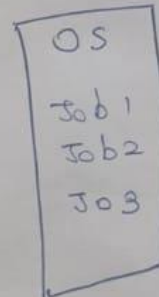

Commonalities

- ① Multiprogramming
- ② Multi tasking

① Multiprogramming → Increases CPU utilization

Job Pool

* No user interaction with computer system

② Multitasking / Time sharing

* User interaction is possible while running

* CPU does multiple jobs by switching among them frequently.

* CPU scheduling is done

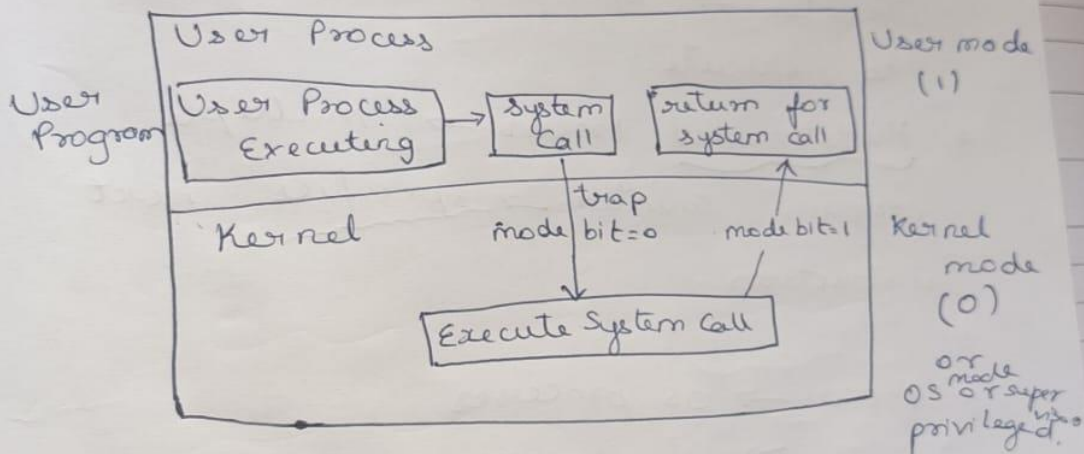

* All user has atleast one program waiting to be executing.

* A program loaded into memory and executing is called a "PROCESS".

Operating system Operations

- * Interrupt driven → H/w
→ s/w exception Trap
(Error) Division by zero exception
(or) invalid memory access.
- * Dual Mode → User Mode (1)
→ Kernel Mode (0)
↑
Mode Bit

Trap or exception → software generated interrupt.
