DEPARTMENT OF MATHEMATICS

Method of variation of parameters:

The Second order linear differential equation is,

$$\frac{d^2y}{dx^2} + P \frac{dy}{dx} + Q \cdot y = R$$

Step 1: Find Complimentary function. From this calculate y , and y . (Coefficient of Constant).

Step 2: Find Wronskian

$$W = \begin{vmatrix} y_1 & y_2 \\ y_1' & y_2' \end{vmatrix} \neq 0$$

$$P \cdot T = Py_1 + G$$
where $P = -\int \frac{R}{W} y_2 dx$

$$Q = \int \frac{R}{W} y_1 dx$$

(i) $\frac{d^2y}{dx^2} + y_1 = Cosec x$
(ii) $y'' + y = Sec^2x$
(iii) $(D^2 + 16)y = Sec 4x$
